- Fax line 1-800-565-7757

Standards of service to the public

Statistics Canada is committed to serving its clients in a prompt, reliable and courteous manner. To this end, Statistics Canada has developed standards of service that its employees observe. To obtain a copy of these service standards, please contact Statistics Canada toll-free at 1-800-263-1136. The service standards are also published on www.statcan.gc.ca under “Contact us” > “Standards of service to the public.”

Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued co-operation and goodwill.

Standard table symbols

The following symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- ^P preliminary
- ^r revised
- X suppressed to meet the confidentiality requirements of the *Statistics Act*
- ^E use with caution
- F too unreliable to be published
- * significantly different from reference category ($p < 0.05$)

Abstract

In order to provide a holographic or complete picture of low income, Statistics Canada implements an approach that uses three complementary low income lines: the Low Income Cut-offs (LICOs), the Low Income Measures (LIMs) and the Market Basket Measure (MBM). While the first two lines were developed by Statistics Canada, the MBM is based on concepts developed by Employment and Social Development Canada. Though these measures differ from one another, they give a generally consistent picture of low income status over time. None of these measures is the best. Each contributes its own perspective and its own strengths to the study of low income, so that cumulatively, the three provide a better understanding of the phenomenon of low income as a whole. These measures are not measures of poverty, but strictly measures of low income.

The LICOs are based on the relationship between the incomes and the consumption patterns of Canadian households as observed in 1992. The LICOs have been very widely used in Canada since the 1970s. On the other hand, the LIM is based solely on the distribution of household income across the Canadian population and is intended as a reference for international comparisons. Statistics Canada has been producing the LIMs since 1991 and they are aligned with the latest international standard. Finally, the MBM defines low income in relation to the cost of a predefined set of goods and services. The price of this “basket” of goods and services takes regional differences in the cost of living into account.

This publication incorporates a detailed description of the methods used to arrive at each of these measurements. It also explains how base years are defined and how LICOs are updated using the Consumer Price Index. Because the LICOs only depend on the annual Consumer Price Index, they can be produced as soon as the CPI is available (January following the reference year). The LIMs and the MBM depend on other survey products that are available much later. Consequently, they can only be produced about 18 months after the end of the reference year. For these reasons, this report contains LICOs up to 2014, but LIMs and MBM up to 2013 only.

This update presents revised LIMs for 2006 to 2011 resulting from the reweighting of data from the Survey of Labour and Income Dynamics (SLID). This reweighting makes it possible to compare results from the Canadian Income Survey (CIS) to earlier years.

Introduction

Statistics Canada has a long history of publishing data on the low income of Canadians. The low income cut-offs (LICOs) were first published in 1967 as part of the 1961 Census monograph series and are by far Statistics Canada's most established and widely recognized approach to estimating low income cut-offs. LICOs are income thresholds below which families devote a larger share of income to the necessities of food, shelter and clothing than the average family would.

Following the practice of many international organizations, Statistics Canada began to publish before- and after-tax low income measures (LIMs) in 1991. LIMs are particularly convenient for making international comparisons, since estimating the cut-offs requires only data on household incomes within a country. As such, they require no adjustments using exchange rates or purchasing power parity indexes as would be necessary to make meaningful comparisons of absolute levels of income between countries.

The Market Basket Measure (MBM) was developed by Employment and Social Development Canada¹ (ESDC) to represent a standard of living that is a compromise between subsistence and social inclusion that reflects differences in living costs across the country (Hatfield, Pyper and Gustajtis 2010). The thresholds are produced for a reference family of two adults and two children for all sizes of area of residence in each province and for several cities. While ESDC is responsible for defining the components of the basket and the related concepts, Statistics Canada is responsible for the costing of the components and producing low income statistics.

Media, researchers and policy-makers interested in measures of low income are typically concerned with the extent to which individuals in the population are living in poverty. Unfortunately, defining poverty is far from straightforward. The underlying difficulty is that poverty is a question of social consensus, defined for a given point in time and in the context of a given country. Decisions on what defines poverty are subjective and ultimately arbitrary (Statistics Canada, 1999 and Skuterud et al., 2004). Given this, Statistics Canada has always referred to the low income lines as indicators of the extent to which some Canadians are less well-off than others, based solely on income and, as such, are low income and not poverty measures.

Other statistical organizations are also sensitive to the use of the word 'poverty'. Eurostat refers to its measure (similar to the LIM) as an 'at risk of poverty' measure. In the United States, where an official poverty measure exists, the poverty rates are qualified as being calculated according to a specified definition, allowing that other measures are possible.

The purpose of this document is to provide the dollar cut-offs used to define the low income population. Low income status can be determined using family or household income. The family concept used is the economic family, that is, all persons living in the same dwelling and related by blood, marriage, common-law relationship or adoption. A household is defined as a person or group of persons residing in a dwelling.

1. Formerly, Human Resources and Skills Development Canada.

Low income cut-offs

What are the LICOs?

The low income cut-offs (LICOs) are income thresholds below which a family will likely devote a larger share of its income on the necessities of food, shelter and clothing than the average family. The approach is essentially to estimate an income threshold at which families are expected to spend 20 percentage points more than the average family on food, shelter and clothing.² The first set of published LICOs used the 1959 Family Expenditure Survey to estimate five different cut-offs varying between families of size one to five.

Today, Statistics Canada continues to use precisely this approach to construct LICOs, with the exception that cut-offs now vary by 7 family sizes and 5 different populations of the area of residence.³ This additional variability is intended to capture differences in the cost of living amongst community sizes.⁴

How are LICOs calculated?

As mentioned previously, a LICO is an income threshold below which a family will likely devote a larger share of its income to the necessities of food, shelter and clothing than an average family would. According to the most recent base for LICOs, the 1992 Family Expenditures Survey, the average family spent 43% of its after-tax income on food, shelter and clothing. Figure 1 shows the calculation of a LICO using the example of a family of four living in a community with a population between 30,000 and 99,999. The 63% line represents the average proportion of after-tax income that all families (regardless of size) spent on food, shelter and clothing in 1992 (i.e. 43%) plus the 20 percentage point margin. The dots on the chart show the actual observed proportion of income spent by four-person families in that community size on necessities, according to the 1992 Family Expenditure Survey. A regression line is fitted to this distribution and the intersection of that curve and the 63% line gives the LICO—in this case, \$21,359.^{5 6 7}

This process is carried out for seven family sizes and five community sizes and results in a table of 35 cut-offs. This operation is done twice: once for before-tax cut-offs, once for after-tax cut-offs.

2. Twenty percentage points are used based on the rationale that a family spending 20 percentage points more than the average would be in "straitened circumstances".

3. As of the Low Income Lines 2009-2010 release, a new naming convention for the geographic classification was introduced for the LICOs grouping them by five community sizes according to Rural areas outside of Census Metropolitan Areas (CMAs) and Census Agglomerations (CAs), and size of CMAs and CAs. The MBM uses these same sizes on a provincial level in addition to several CMAs and CAs. Please refer to Tables A and B of the Low Income Lines 2009-2010 release (Statistics Canada, 2011b).

4. The LICOs were revised in early 2005 to incorporate revised weights from the 1992 Family Expenditure Survey, which were part of the 2003 Survey of Household Spending historical revision.

5. The model is the following: the logarithm of spending on food, shelter and clothing is a function of the logarithm of income, family size, population of the area of residence and region.

6. It can clearly be seen that as income increases, the proportion spent on food, shelter and clothing decreases. In this case, points to the left of the intersection point between the regression curve and 63% line represent situations where more than 63% of after-tax income is spent on necessities.

7. All dollar values are expressed in current dollars.

Figure 1
Calculation of an after-tax LICO

Source: Survey of Family Expenditures (Famex), 1992.

Rebasing and indexing the LICOs

Over time, Canadian families have spent a smaller percentage of their income on the necessities of food, shelter and clothing. This relationship between families’ income and spending is associated with a specific point in time, i.e. the year of the expenditure survey used to derive the cut-offs. That particular year is referred to as the base year for the set of cut-offs. In order to account for changing spending patterns, Statistics Canada has in the past recalculated new LICOs after each subsequent Family Expenditure Survey. This process is referred to as rebasing and includes recalculating new LICOs using the method described in “How are low income cut-offs calculated?” and the new spending data. In addition to the 1992 base, LICOs have also been based on the 1986, 1978, 1969 and 1959 Family Expenditure Surveys; although cut-offs based on 1992 are the most commonly used and are available for the income reference years from 1976 onwards.⁸

After having calculated LICOs in the base year, cut-offs for other years are obtained by applying the corresponding Consumer Price Index (CPI) inflation rate to the cut-offs from the base year – the process of indexing the LICOs. The CPI are provided at the end of this document. For example, continuing with the 1992 after-tax LICO for a family of four living in a community with a population between 30,000 and 99,999; to calculate the corresponding LICO for 2014, the Consumer Price Index is used as follows:

$$SFR_{2014} = SFR_{1992} \times IPC_{2014} / IPC_{1992} = 21,359 \times 125.2 / 84.0 = 31,835$$

8. In 1997, the Family Expenditure Survey was replaced by the Survey of Household Spending, an annual survey. Therefore, theoretically new rebased LICOs could be produced annually (see Cotton, Webber, Saint-Pierre (1999) for more details).

Thus for 2014, the 1992 based after-tax LICO for a family of four living in a community with a population between 30,000 and 99,999 is \$31,835, expressed in current dollars.

Because the LICOs only depend on the annual Consumer Price Index, they can be produced as soon as the CPI is available, that is January following the reference year.

Note that using the CPI to update the cut-offs takes inflation into account, but does not reflect any changes that might occur over time in the average spending on necessities.

Use of after-tax and before-tax LICOs

The average proportion of income that families spend on food, shelter and clothing, which figures prominently in the low income cut-offs, is undoubtedly a useful gauge of economic well-being no matter which income concept is used. The choice of after-tax income, total income or market income depends on whether one wants to take into account the added spending power that a family gets from receiving government transfers or its reduced spending power after paying taxes.

Statistics Canada produces two sets of low income cut-offs and their corresponding rates—those based on total income (i.e., income including government transfers, before the deduction of income taxes) and those based on after-tax income. Derivation of before-tax versus after-tax low income cut-offs are each done independently. There is no simple relationship, such as the average amount of taxes payable, to distinguish the two types of cut-offs.

Although both sets of low income cut-offs and rates continue to be available, Statistics Canada prefers the use of the after-tax measure.

The choice to highlight after-tax rates was made for two main reasons. First, income taxes and transfers are essentially two methods of income redistribution. The before-tax rates only partly reflect the entire redistributive impact of Canada's tax/transfer system because they include the effect of transfers but not the effect of income taxes. Second, since the purchase of necessities is made with after-tax dollars, it is logical to use people's after-tax income to draw conclusions about their overall economic well-being.

Differences in after-tax and before-tax rates

The number of people falling below the cut-offs has been consistently lower on an after-tax basis than on a before-tax basis. This result may appear inconsistent at first glance, since incomes after tax cannot be any higher than they are before tax, considering that all transfers, including refundable tax credits, are included in the definition of "before-tax" total income. However, with a relative measure of low income such as the LICO, this result is to be expected with any income tax system which, by and large, taxes those with more income at a higher rate than those with less. These "progressive" tax rates compress the distribution of income. Therefore, some families in low income before taking taxes into account are relatively better off and not in low income on an after-tax basis.

Low income measures

What is the LIM?

For the purpose of making international comparisons, the LIM is the most commonly used low income measure. In simple terms, the LIM is a fixed percentage (50%) of median adjusted household⁹ income, where "adjusted" indicates that household needs are taken into account. Adjustment for household sizes reflects the fact that a household's needs increase as the number of members increases. Most would agree that a household of six has greater needs than a household of two, although these needs are not necessarily three times as costly.

The LIMs are calculated three times for each year; with market income, before-tax income, and after-tax income drawn from an annual survey of household income.¹⁰ Because a new set of LIMs is calculated each year using new data, they do not require updating using an inflation index. Unlike the low income cut-offs, which are derived from an expenditure survey and then compared to an income survey, the LIMs are both derived and applied using a single income survey.

9. A household is defined as a person or group of persons residing in a dwelling.

10. Starting with reference year 1998, the Survey of Labour and Income Dynamics (SLID) replaced the annual SCF as the major source of information on family income. Over the 1993 to 1997 period, the two surveys were run in parallel: estimates for this period are produced by combining both samples. Starting with the 2012 reference year, annual individual and family income data is produced by the Canadian Income Survey (CIS).

How is the LIM calculated?

In order to calculate the LIMs¹¹, first calculate “equivalent household income” for each household by dividing household income by its “adjusted size”, that is the square root of the number of persons in the household. Next, assign this adjusted household income to each individual in the household. Then, determine the median of this “equivalent household income” over the population of individuals; that is, the amount where half of all individuals will be above it and half below. The LIM for a household of one person is 50% of this median “equivalent household income”, and the LIMs for other sizes of households are equal to this value multiplied by their “equivalent household size”.

Market Basket Measure (2011 base)

What is the MBM?

The MBM is a measure of low income based on the cost of a specific basket of goods and services representing a modest, basic standard of living. It includes the costs of food, clothing, footwear, transportation, shelter and other expenses for a reference family of two adults aged 25-49 and two children (aged 9 and 13). It provides thresholds for a finer geographic level than the LICO, allowing, for example, different costs for rural areas in the different provinces. These thresholds are compared to disposable income of families to determine low income status.

Disposable income is defined as the sum remaining after deducting the following from total family income: total income taxes paid; the personal portion of payroll taxes; other mandatory payroll deductions such as contributions to employer-sponsored pension plans, supplementary health plans, and union dues; child support and alimony payments made to another family; out-of-pocket spending on child care; and non-insured but medically prescribed health-related expenses such as dental and vision care, prescription drugs, and aids for persons with disabilities.

The MBM, including its definition of disposable income, was designed by a working group of Federal, Provincial and Territorial officials, led by ESDC between 1997 and 1999 (Hatfield 2002; Michaud, Cotton and Bishop 2004). During 2009 and early 2010, the MBM underwent a comprehensive review of both content and methodology (Hatfield, Pyper and Gustajtis 2010). Though led by ESDC, the consultation process involved officials from Provincial and Territorial governments, other federal departments and agencies including Statistics Canada and a panel of experts in low income measurement. This review process led to a rebased series of thresholds (MBM 2008 base) which was revised historically to 2000, the beginning of the MBM time series. Among the changes to the MBM resulting from the comprehensive review was the revision of the shelter component to include the costs of homeowners without mortgages. This revision recognized that, in a given year, homeowners without mortgages may pay less for shelter than they would if they were renting.

During 2012, ESDC officials re-examined the methodology for including homeowners without mortgages in order to better implement the conceptual decision to reflect these costs in the MBM. Following this re-examination, a revised methodology was adopted that adjusts the MBM disposable income of homeowners without mortgages to account for the potential differences in their shelter-related expenses. Specifically, the disposable income is adjusted in the following manner:

11. The methodology utilized for calculating the LIMs changed substantially beginning with the release of “Low Income Lines, 2008-2009” and the 2008 SLID. These changes relate to the accounting unit utilized, the unit of analysis and the equivalence scale. For a complete description of the changes, please see “Low Income Lines, 2008-2009”.

1. Shelter cost for mortgage-free owners is calculated, based on the median shelter cost for all two- and three- bedroom mortgage-free dwellings in each MBM region. These shelter costs reflect the actual distribution of two- and three-bedroom mortgage-free units in each MBM region.
2. Mortgage-free owners' difference in expenditures is calculated as the difference in the median shelter cost calculated in 1. above and that of renters (i.e. the cost of the shelter component)
3. Disposable income of owners without mortgages is adjusted by adding the mortgage-free owners' difference in expenditures prevailing in their MBM region to their MBM disposable income. Table A provides detailed information of the amounts of these adjustments in each MBM region.

The shelter thresholds themselves are exclusively a reflection of the median costs for all two- and three-bedroom rental units in each MBM region, weighted to take into account the actual distribution of such units. The revision took effect in 2011 and included an historical revision back to 2002 (the first year in which housing tenure information is available in SLID).

1. To convert to other family sizes, divide these values by 2 (the square root of the reference family size of four persons) and then multiply by the square root of the desired family size. For example, if the MBM threshold for a given region is \$27,500 for the reference family of two adults and two children, to convert this threshold to a three-person family, the following calculation is made: $(\$27,500 \div 2) \times (\text{square root of } 3) \Rightarrow \$13,750 \times 1.732 \Rightarrow \$23,816$

To convert the threshold to a two-person family, the following calculation is made: $(\$27,500 \div 2) \times (\text{square root of } 2) \Rightarrow \$13,750 \times 1.414 \Rightarrow \$19,445$

To convert the threshold to a single-person family, the following calculation is made: $(\$27,500 \div 2) \times (\text{square root of } 1) \Rightarrow \$13,750 \times 1 \Rightarrow \$13,750$

2. Rural: rural areas located outside a Census Metropolitan Area or Census Agglomeration. Can include some small population centres.

Less than 30,000: Census Agglomeration or population centres less than 10,000 inhabitants.

30,000 - 99,999: Census Agglomeration between 30,000 - 99,999 inhabitants.

100,000 – 499,999: Census Metropolitan Area between 100,000 – 499,999 inhabitants.

Specific city name refers to the population within the CMA or CA.

How are MBM thresholds calculated?

The MBM thresholds are calculated as the cost of purchasing the following items:

- A nutritious diet as specified in the 2008 National Nutritious Food Basket (Health Canada 2009).
- A basket of clothing and footwear required by a family of two adults and two children.
- Shelter cost as the median cost of two- or three-bedroom rental units including electricity, heat, water and appliances. Shelter cost of mortgage-free owners is no longer reflected in the thresholds, but rather in the disposable income of individual reference families for whom it applies.
- Transportation costs, using public transit where available or costs associated with owning and operating a modest vehicle where public transit is not available.
- Other necessary goods and services.

Low income rate and low income gap ratio

To determine whether a person is in low income, the appropriate low income line (LIL) is compared to the income of the person's family¹² (or household)¹³. If their income is below the LIL, the individual is considered to be in low income. In other words, "persons in low income" should be interpreted as persons who are part of low income families (or households), including persons living alone whose income is below the LIL. Similarly, "children in low income" means "children who are living in low income families (or households)". Overall, the low income rate for persons can then be calculated as the number of persons in low income divided by the total population. The same can be done for various sub-groups of the population; for example, low income rates by age, sex, or province.

After having determined that an individual is in low income, the low income gap ratio can be calculated by using the amount that the person's family (or household) income falls short of the LIL, expressed as a percentage of the LIL¹⁴. For example, an individual living in a family (or household) with an income of \$15,000 and a LIL of \$20,000 would have a low income gap of \$5,000. In percentage terms, the "gap ratio" would be 25%¹⁵. The average gap ratio for a given population is the average of these values as calculated for each person.

12. The family concept used is the economic family, that is, all persons living in the same dwelling and related by blood, marriage, common-law relationship or adoption.

13. When using the LICO or the MBM, the economic family is the appropriate unit. When using the LIM, the household is the appropriate unit.

14. See "What you should know" section of the 2009 Income in Canada release for a more detailed explanation (Statistics Canada, 2011a).

15. For the calculation of this low income gap, negative incomes are treated as zero.

2004	31,968	36,078	31,020
2005	33,216	37,380	32,326
2006	34,206	38,788	33,584
2007	35,582	40,506	35,460
2008	37,878	42,754	37,466
2009	37,414	42,636	37,724
2010	37,968	43,638	38,444
2011	39,810	45,668	39,960
2012	41,624	47,208	41,568
2013	42,402	47,878	41,866

Notes:

1. To convert to other household sizes, divide these values by 2 (the square root of the household size of four persons) and then multiply by the square root of the desired household size.
2. The LIMs were calculated using the following surveys: the SCF from 1976 to 1992, a combination of the SCF and the SLID from 1993 to 1997, the SLID from 1998 to 2011 and the CIS beginning in 2012.

Vancouver	29,532	30,012	30,507	31,142	32,325	32,696	34,380	36,019	36,522	37,663	38,524	38,717

1. To convert to other family sizes, divide these values by 2 (the square root of the reference family size of four persons) and then multiply by the square root of the desired family size. For example, if the MBM threshold for a given region is \$27,500 for the reference family of two adults and two children, to convert this threshold to a three-person family, the following calculation is made: $(\$27,500 \div 2) \times (\text{square root of } 3) \implies \$13,750 \times 1.732 \implies \$23,816$

To convert the threshold to a two-person family, the following calculation is made: $(\$27,500 \div 2) \times (\text{square root of } 2) \implies \$13,750 \times 1.414 \implies \$19,445$

To convert the threshold to a single-person family, the following calculation is made: $(\$27,500 \div 2) \times (\text{square root of } 1) \implies \$13,750 \times 1 \implies \$13,750$

2. Rural: rural areas located outside a Census Metropolitan Area or Census Agglomeration. Can include some small population centres.

Less than 30,000: Census Agglomeration or population centres less than 10,000 inhabitants.

30,000 - 99,999: Census Agglomeration between 30,000 - 99,999 inhabitants.

100,000 - 499,999: Census Metropolitan Area between 100,000 - 499,999 inhabitants.

Specific city name refers to the population within the CMA or CA.

Annex: Historical low income cut-offs (LICOs) for the base years 1959 (for 1969), 1969, 1978, and 1986

Size of family unit	All areas no distinction by community size				
	current dollars				
	1 person	2 persons	3 persons	4 persons	5 or more persons
1969	1,894	3,157	3,788	4,420	5,051

Note: The 1959-based low-income cut-offs were published only starting with 1969.

Table A.2
Low-income cut-offs (LICOs), 1969 base, before tax

Size of family unit	Community size				
	Rural areas outside CMA or CA ¹	Census Agglomeration (CA)		Census Metropolitan Area (CMA)	
		Less than 30,000 inhabitants ²	Between 30,000 and 99,999 inhabitants	Between 100,000 and 499,999 inhabitants	500,000 inhabitants or more
current dollars					
1969					
1 person	1,890	2,174	2,363	2,434	2,599
2 persons	2,741	3,152	3,426	3,529	3,769
3 persons	3,498	4,022	4,372	4,503	4,809
4 persons	4,159	4,783	5,199	5,355	5,719
5 persons	4,650	5,347	5,812	5,986	6,393
6 persons	5,104	5,870	6,380	6,571	7,018
7 or more persons	5,596	6,435	6,995	7,205	7,695

Notes:

1. Can include some small population centres.
2. Includes population centres with less than 10,000 inhabitants.

Table A.3
Low-income cut-offs (LICOs), 1978 base, before tax

Size of family unit	Community size				
	Rural areas outside CMA or CA ¹	Census Agglomeration (CA)		Census Metropolitan Area (CMA)	
		Less than 30,000 inhabitants ²	Between 30,000 and 99,999 inhabitants	Between 100,000 and 499,999 inhabitants	500,000 inhabitants or more
current dollars					
1978					
1 person	4,400	4,900	5,300	5,650	5,950
2 persons	5,750	6,450	6,950	7,450	7,850
3 persons	7,700	8,650	9,300	9,950	10,500
4 persons	8,900	10,000	10,750	11,500	12,100
5 persons	10,350	11,600	12,450	13,350	14,100
6 persons	11,300	12,650	13,600	14,550	15,400
7 or more persons	12,450	13,950	15,000	16,050	16,950

Notes: After-tax LICOs were never published on a 1959 base, 1969 base, or 1978 base.

1. Can include some small population centres.
2. Includes population centres with less than 10,000 inhabitants.

Table A.4
Low-income cut-offs (LICOs), 1986 base, before tax

Size of family unit	Community size				
	Rural areas outside CMA or CA ¹	Census Agglomeration (CA)		Census Metropolitan Area (CMA)	
		Less than 30,000 inhabitants ²	Between 30,000 and 99,999 inhabitants	Between 100,000 and 499,999 inhabitants	500,000 inhabitants or more
	current dollars				
1986					
1 person	8,065	9,266	10,165	10,405	11,847
2 persons	10,933	12,561	13,779	14,105	16,059
3 persons	13,896	15,966	17,514	17,928	20,412
4 persons	15,999	18,382	20,164	20,641	23,501
5 persons	17,480	20,084	22,031	22,552	25,677
6 persons	18,974	21,800	23,914	24,479	27,871
7 or more persons	20,408	23,448	25,721	26,329	29,977

Notes:

1. Can include some small population centres.

2. Includes population centres with less than 10,000 inhabitants.

Table A.5
Low-income cut-offs (LICOs), 1986 base, after tax

Size of family unit	Community size				
	Rural areas outside CMA or CA ¹	Census Agglomeration (CA)		Census Metropolitan Area (CMA)	
		Less than 30,000 inhabitants ²	Between 30,000 and 99,999 inhabitants	Between 100,000 and 499,999 inhabitants	500,000 inhabitants or more
	current dollars				
1986					
1 person	6,414	7,532	8,381	8,607	10,045
2 persons	8,696	10,212	11,364	11,669	13,620
3 persons	11,258	13,220	14,711	15,107	17,632
4 persons	13,242	15,550	17,304	17,769	20,739
5 persons	14,407	16,919	18,826	19,333	22,565
6 persons	15,399	18,083	20,123	20,664	24,118
7 or more persons	16,372	19,226	21,394	21,969	25,641

Notes:

1. Can include some small population centres.

2. Includes population centres with less than 10,000 inhabitants.

Annual consumer price index for Canada, all items (2002=100)

Year	Consumer Price Index	Year	Consumer Price Index	Year	Consumer Price Index
1960	15.5	1980	44.0	2000	95.4
1961	15.7	1981	49.5	2001	97.8
1962	15.9	1982	54.9	2002	100.0
1963	16.1	1983	58.1	2003	102.8
1964	16.4	1984	60.6	2004	104.7
1965	16.8	1985	63.0	2005	107.0
1966	17.5	1986	65.6	2006	109.1
1967	18.1	1987	68.5	2007	111.5
1968	18.8	1988	71.2	2008	114.1
1969	19.7	1989	74.8	2009	114.4
1970	20.3	1990	78.4	2010	116.5
1971	20.9	1991	82.8	2011	119.9
