#### To access this product

This product, Catalogue no. 91-215-X, is available free in electronic format. To obtain a single issue, visit our website, *www.statcan.gc.ca* and browse by "Key resource" > "Publications."

#### Standards of service to the public

Statistics Canada is committed to serving its clients in a prompt, reliable and courteous manner. To this end, this agency has developed standards of service that its employees observe. To obtain a copy of these service standards, please contact Statistics Canada toll-free at 1-800-263-1136. The service standards are also published at *www.statcan.gc.ca* under "About us" > "The agency" > "Providing services to Canadians."

# Annual Demographic Estimates: Canada, Provinces and Territories

# **User information**

#### **Symbols**

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0<sup>s</sup> value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the Statistics Act
- E use with caution
- F too unreliable to be published
- \* significantly different from reference category (p < 0.05)

# **Notice to readers**

Estimates released in this publication are based on the 2011 Census counts adjusted for census net undercoverage and incompletely enumerated Indian reserves to which is added the estimated demographic growth for the period going from May 10, 2011 to the date of the estimate.

These estimates are not to be mistaken with the 2011 Census counts.

The analysis in this publication is based on preliminary data. These data will be revised over the coming years, and it is possible that some trends described in this publication will change as a result of these revisions. Therefore, this publication should be interpreted with caution.

Most of the components, used to produce preliminary population estimates, are estimated using demographic models or based on data sources less complete or reliable, albeit more timely, than those used for updated or final estimates.

# Acknowledgements

The analysis of this publication was prepared by André Lebel and Patrick Charbonneau of the Analysis unit with the collaboration of Hélène Landry and Julie Dussault, all of the Population estimates section of the Demography division of Statistics Canada. The authors would also like to thank for their valuable comments: Marc Lachance and Hubert Denis.

#### **Total population**

- On July 1, 2015, Canada's population was estimated at 35.9 million, up 308,100 in the past year (2014/2015).
- The country's population annual growth rate was 0.9%, down slightly from 2013/2014 (+1.1%) and the weakest
  growth observed since 1998/1999 (+0.8%).
- Despite this slowdown, Canada's population growth remained the strongest among G7countries.
- In 2014/2015, net international migration was responsible for 60.8% of the population growth in Canada.
- Net international migration was estimated at 187,400 people, down 27.7% from the previous year (+259,100) and at its lowest level in absolute numbers since 2002/2003.
- In the year ending June 30, 2015, the annual number of immigrants was estimated to 239,800, the lowest level since 2006/2007 (238,100).
- For this period, the number of non-permanent residents (NPR) decreased (-10,300) for the first time since 1997/1998 (-4,000), the largest drop since 1994/1995 (-14,200).
- Population growth over the last year was negative in Newfoundland and Labrador (-0.2%) and New Brunswick (-0.1%) and strongest in Nunavut (+2.3%) and Alberta (+1.8%).
- Alberta posted the strongest slowdown of its population growth compared to 2013/2014, falling by one percentage point from +2.8% to +1.8%.
- For a second year in a row, Newfoundland and Labrador recorded a negative natural increase (-0.1%).
- Alberta recorded a large decrease of net international migration, from +1.1% in 2013/2014 to +0.3% in 2014/2015.
- Net interprovincial migration was positive for only two provinces: Alberta (+28,900 or +0.7%) and British Columbia (+12,400 or +0.3%).

#### Population by age and sex

- On July 1, 2015, preliminary estimates show that, for the first time, Canada had more people 65 years and older than children aged 0 to 14.
- About 5.8 millions Canadians, or nearly one in six people (16.1%), were at least 65 years old on July 1, 2015.
- Among G7 members, Canada has one of the lowest proportions of people aged 65 and older.
- On July 1, 2015, New Brunswick was the province with the largest proportion of people aged 65 and older (19.0%), while Nunavut had the lowest proportion (3.7%).

- One Canadian in two was at least 40.5 years of age. The median age of Canada's population has risen by 5.7 years in the past 20 years
- The median age in 2015 is higher for women (41.4 years) than for men (39.6 years).
- On July 1, 2015, centenarian population in Canada was estimated to 8,100 or about 22 centenarians per 100,000 persons, and were mostly women (88.4%).

# **Section 1**

#### **Total population**

This section primarily presents the preliminary population estimates for Canada, the provinces and territories on July 1, 2015, along with a concise analysis of the various components of population growth.

#### Chart 1.1

#### Population growth rate, 1994/1995 to 2014/2015, Canada

#### percent

## 1.1 Slowdown in Canada's population growth

On July 1, 2015, Canada's population was estimated at 35.9 million, up 308,100 in the past year (2014/2015). The country's population growth rate was 0.9%,<sup>1</sup> down slightly from 2013/2014 (+1.1%) and the lowest growth observed since 1998/1999 (+0.8%). However, despite this slowdown, Canada's population growth remained the strongest among G7<sup>2</sup> countries. Canada's rate surpasses that of the United States (+0.7%), the United Kingdom (+0.2%), France (+0.4%), Germany (+0.1%), and Italy and Japan, whose populations remained relatively stable.

For the purpose of calculating rates, the denominator is the average population (namely, the average of the start-of-period and end-of-period populations) during the period.

The G7 is an informal discussion group and economic partnership consisting of seven of the world's most powerful economies: the United States, Japan, Germany, France, United Kingdom, Italy and Canada. Sources: Eurostat (January 2014 to January 2015), Statistics Bureau of Japan (August 2014 to August 2015) and U.S. Census Bureau (July 2014 to July 2015); calculations by the author.

## 1.2 Natural increase is positive across the country

Population growth at the national level is based on two factors—natural increase<sup>3</sup> and net international migration<sup>4</sup> while provincial and territorial population

3. Natural increase is the difference between the number of births and deaths.

4. Net international migration basically refers to the number of moves between Canada and abroad, resulting in a change in usual place of residence. It is calculated by adding immigration, subtracting emigration, adding returning emigration, subtracting net temporary emigration (+ or -) and lastly, adding net non-permanent residents (+ or -). estimates also factor in migration exchanges between provinces and territories. Over the past year, natural increase was estimated at 120,700, based on the difference between 388,700 births and 268,100 deaths according to preliminary estimates. The number of people added by natural increase in the past year (2014/2015) fell 8,400 over the previous year (2013/2014). This phenomenon is explained by a faster increase in the number of deaths than births, and is linked mainly to population aging, since a greater proportion of the population falls into the ages where the intensity of mortality is higher.

1. Residual deviation is included in the net international migration until year ending on June 30, 2011.

# 1.3 Population growth due mainly to international migration

Net international migration is an increasingly important driver of Canada's population growth, and since 1995/1996, has consistently been the main source of that growth.<sup>5</sup> In 2014/2015, net international migration was responsible for 60.8% of the population growth in Canada. By comparison, net international migration accounted on average for 34.7% of population growth in the 1980s. For the

year ending June 30, 2015, net international migration was estimated at 187,400 people, down 27.7% from the previous year (+259,100) and at its lowest level in terms of numbers since 2002/2003.

<sup>5.</sup> For intercensal periods, total growth does not consist solely of natural increase and international migration. It also includes the residual error, which is the difference between the population growth calculated from intercensal population estimates between two censuses and the population growth calculated by adding the components for the same period. The residual error is subtracted here from net international migration to simplify the analysis.

# 1.4 More than 85% of immigrants settle in Ontario, Quebec, Alberta and British Columbia

In the year ending June 30, 2015, 239,800 immigrants took up residence in Canada, the first time in six years that this number has fallen below 250,000 and the lowest level since 2006/2007 (238,100). In 2014/2015, the immigration rate in Canada was estimated at 0.7%. In recent decades, the regional distribution of immigration in Canada has changed in favour of the western provinces and to the detriment mainly of Ontario, which has seen its share of immigrants decline over the past decade. In 2014/2015, Ontario continued to be the province that welcomed the most immigrants to the country with 37.3%, compared with 49.0% on average over the past 20 years.

# 1.5 The number of non-permanent residents is declining

Net non-permanent residents is the variation in the number of non-permanent residents on a specific date between two years. In 2014/2015, the number of net non-permanent residents (NPR) was negative (-10,300), indicating that the number of NPRs decreased between July 1, 2014 and July 1, 2015.

This is the first time this situation has been seen since 1997/1998 (-4,000) and is the largest loss in NPRs since 1994/1995 (-14,200).

Emigration<sup>6</sup> was estimated at 42,000 for the year ending June 30, 2015 and continued to be concentrated mainly in four provinces: Ontario (38.8%), British Columbia (31.6%), Alberta (12.3%) and Quebec (11.7%).

#### 1.6 More than four out of five Canadians live in four provinces

On July 1, 2015, almost 31 million Canadians (86.3%) lived in four provinces: Ontario (38.5%), Quebec (23.0%), British Columbia (13.1%) and Alberta (11.7%). Ontario remained Canada's most populous province, 13.8 million residents. The province with the smallest population was Prince Edward Island, with 146,400 residents. With 8.3 million residents, Quebec continued to rank second in terms of population size in Canada, followed by British Columbia with 4.7 million and Alberta with 4.2 million people.

In this context, emigration represents the difference between emigration and return emigration, to which net temporary emigration is added.

#### Chart 1.3

Population distribution by province or territory, July 1, 2015

#### Provinces and territories

## 1.7 Population growth in Alberta slows

Compared with 2013/2014, population growth<sup>7</sup> in the past year was weaker nationally and in most provinces, especially Alberta. However, population growth was more sustained in 2014/2015 in Nunavut (from +1.8% to +2.3%) and in Nova Scotia (from -0.1% to +0.1%). Preliminary estimates<sup>8</sup> for 2014/2015 show that population growth was negative in Newfoundland and Labrador (-0.2%) and New Brunswick (-0.1%) and

strongest in Nunavut (+2.3%) and Alberta (+1.8%). It was also more sustained in Manitoba (+1.0%), Saskatchewan (+1.0%), British Columbia (+1.0%) and Yukon (+1.2%) than nationally (+0.9%). In relative terms, Alberta posted the biggest slowdown in its population growth compared with 2013/2014, falling one percentage point from +2.8% to +1.8%. Based on preliminary estimates, this slowdown is the result of a significant decrease in net international migration (from +44,900 in 2013/2014 to +13,100 in 2014/2015) and, to a lesser degree, a decrease in Alberta's gains through its migratory exchanges with the other provinces and territories (from +35,400 in 2013/2014 to +28,900 in 2014/2015).

<sup>7.</sup> For the rest of this analysis, a rate higher than -0.1% and lower than 0.1% is considered not significant and relatively stable.

<sup>8.</sup> Preliminary postcensal estimates are subject to revision. Future updates could affect the trends in this analysis.

### Chart 1.4 Population growth rate, 2013/2014 and 2014/2015, Canada, provinces and territories

### 1.8 Newfoundland and Labrador records negative natural increase

At the national level, the natural increase rate was 0.3% in 2014/2015, its lowest level since 2004/2005. In general, natural increase was weaker in the Atlantic provinces and stronger in the Prairie provinces and the territories. For a second straight year, Newfoundland and Labrador recorded a negative natural increase (-0.1%), indicating that this province had more deaths

(5,000) than births (4,400) in the past year. Natural increase was also negative on an annual basis for the first time in Nova Scotia (-0.1%), based on preliminary estimates. Nunavut again recorded the strongest rate of natural increase in Canada at +1.9%, which can be attributed to its young population and one of the highest fertility rates in the country. Among the provinces, Alberta continues to have the strongest rate of natural increase (+0.8%), a position it has held consistently since 1980/1981.

#### Chart 1.5

#### Factors of population growth, 2014/2015, Canada, provinces and territories

Provinces and territories

■Natural increase ■International migration □Interprovincial migration •Population growth rate

# 1.9 International migration: Key driver of growth in several provinces

In 2014/2015, net international migration was the main driver of population growth in Prince Edward Island, Nova Scotia, Quebec, Ontario, Manitoba, Saskatchewan and British Columbia. Canada's net international migration rate was 0.5% in 2014/2015, down from the level estimated in the previous year (+0.7%) and the lowest level since 1998/1999 (+0.4%). In 2014/2015, the net international migration rate was higher than the national average (0.5%) in four provinces: Manitoba (+1.2%), Prince Edward Island (+1.0%), Saskatchewan (+0.8%) and Ontario (+0.6%). In relative terms, Alberta is the province that recorded the biggest drop in its net international migration, from +1.1% in 2013/2014 to +0.3% in 2014/2015. This situation is the result of a decrease in the number of non-permanent residents (-21,200 in 2014/2015) in the last year, compared with an increase in the previous year (+9,000 in 2013/2014) and, to a lesser extent,

fewer immigrants (41,100 in 2013/2014 compared with 39,400 in 2014/2015).

### 1.10 Two provinces saw gains in internal migration

At the provincial and territorial levels, population growth is also the result of migration between the provinces and territories. For the year ending June 30, 2015, preliminary estimates show that net interprovincial migration was positive for only two provinces: Alberta (+28,900 or +0.7%) and British Columbia (+12,400 or +0.3%). However, migration gains in these two provinces evolved differently in the last year, with British Columbia recording an increase of 31.0% and Alberta seeing a decline of 18.3% compared with 2013/2014. In the past year, Prince Edward Island and Quebec recorded their biggest losses in interprovincial migration in absolute terms since 1980/1981 and 1997/1998 respectively.

Chart 1.6 Interprovincial migration by province or territory, 2014/2015

#### 1.11 Biggest migration flows involve Alberta

The most important migration flows (20.0% higher) are showed in the following circular chart,<sup>9</sup> in which each province or territory is assigned a colour. Origins and destinations are represented by the circle's segments. Flows have the same colour as their origin, the width indicates their size and the arrow their direction. The largest interprovincial migrations in the past year occurred from Ontario to Alberta (+26,000 or 0.2%), from Alberta to British Columbia (+24,500 or +0.6%), from British Columbia to Alberta (+22,500 or +0.5%) and also, from Quebec to Ontario (+17,700 or +0.2%). In these migratory exchanges with Alberta, British Columbia gained more migrants than it lost, resulting in a net gain of 2,100. In relative terms, the highest interprovincial migration rates<sup>10</sup> are those into Alberta from Saskatchewan (+0.9%), Prince Edward Island (+0.7%) and Newfoundland and Labrador (+0.6%).

For more details and information on the origin and interpretation of this chart, readers are encouraged to consult the articles from the Vienna Institute of Demography: Sander et al. (2014), "Visualising Migration Flow Data" and Abel (2015), "Estimates of Global Bilateral Migration Flows by Gender between 1960 and 2010".

<sup>10.</sup> Rates are based on the average population over the period of the population of origin.

#### Chart 1.7

Largest interprovincial migration flows, by province or territory of origin and destination, 2014/2015

1. Preliminary estimates based on data from the Canada Child Tax Benefit (CCTB) Program and F<sub>jk</sub> factors calculated using 2011/2012, 2012/2013 and 2013/2014 tax file data from Canada Revenue Agency.

# Population by age and sex

This section presents an analysis of the population estimates by age and sex for Canada, the provinces and territories on July 1, 2015.

# 2.1 Baby boomers accelerate the aging of Canada's population

Population aging represents one of the major changes associated with Canada's age-sex structure and will alter the portrait of the country's population. This phenomenon is the result of baby boomers (born between 1946 and 1965) reaching more advanced ages, combined with a fertility rate below the replacement level and an increase in life expectancy. The age pyramid opposite (Figure 2.1) shows the aging of Canada's population in recent decades by comparing the age-sex structure of the Canadian population on July 1, 1995 and 2015. Twenty years ago, baby boomers were in their thirties and forties, as evidenced by the bulge in the 1995 pyramid at these age groups. On July 1, 2015, individuals from the baby boom generation were between 49 and 69 years of age. In recent years, they have therefore contributed to expanding the size of the population 65 years and older. As a result, the number of people aged about 50 years and older is proportionately greater in 2015 than in 1995, as shown in Figure 2.1. In contrast, almost all of the younger age groups account for a smaller proportion of the Canadian population in 2015 than in 1995.

#### Figure 2.1

#### Age pyramid of population estimates as of July 1, 1995 and 2015, Canada

# 2.2 Persons 65 years and older now outnumber children aged 0 to 14 years

On July 1, 2015, preliminary estimates show that, for the first time, Canada had more people 65 years and older than children aged 0 to 14. The Canadian population 65 years and older consisted of 31,500 more people than children aged 0 to 14 years. By comparison, in 1986, there were twice as many children aged 0 to 14 years as people 65 years and older.

A record 5,780,900 Canadians, or nearly one in six people (16.1%), were at least 65 years old on July 1, 2015. This number is slightly higher than the number of children aged 0 to 14, which was 5,749,400 (16.0%). According to the medium-growth (M1) scenario of the most recent population projections, the proportion of people 65 years of age should continue to grow and to widen the gap with the proportion of children 0 to 14 years.<sup>1</sup> The proportion of the population 65 years and older should reach 20% in 2024 and 25% in 2055, while the proportion of children aged 0 to 14 should remain stable at around 15% to 16% over the same time span.

## Chart 2.1

### Population aged 0 to 14 years and 65 years and over, 1995 to 2035, Canada

**Note:** From 1995 to 2015, population estimates. From 2016 to 2035, Population Projections for Canada (2013 to 2063), Provinces and Territories, (2013 to 2038), Catalogue no. 91-520-X.

In the past annual period, the growth rate of the population 65 years and older was 3.5%, about four times the growth rate for the population as a whole (0.9%). The annual growth rate for this age group has been accelerating since the beginning of the decade,

and more specifically in 2011, when the first members of the baby boom generation started reaching 65 years of age. On July 1, 2015, 18.2% of the members of the baby boom generation were aged 65 and older.

Population Projections for Canada (2013 to 2063), Provinces and Territories (2013 to 2038), Catalogue no. 91-520-X. The M1 scenario (medium growth, trends 1991/1992 to 2010/2011) was considered.

Moreover, within this age group, 30.2% were baby boomers.

The growth rate of the 0-to-14 population was 0.7% in the last annual period. Though this growth was positive, it was still below that of persons aged 65 and older, and thus contributes to the aging of the population.

# 2.3 Canada is younger than most G7 countries

Population aging is a widespread phenomenon in the industrialized world. In recent years, the proportion of persons aged 65 years and older has grown in every G7 country. Among G7 members, Canada has one of the lowest proportions of people aged 65 and older. In contrast, Japan has one of the oldest populations in the world and the highest proportion of people 65 years and older in the G7 (26%),<sup>2</sup> or just over one in four people.

The United States is the only G7 country in which the proportion of people aged 65 and older is lower (15%) than in Canada (16.1%).

The proportion of children aged 0 to 14 years is higher in Canada (16.0%) than in Japan (13%), Germany (13%) and Italy (14%). The fact that Canada has proportionally more children aged 0 to 14 than these three countries is due mainly to a higher fertility rate in Canada. However, the proportion of children is lower in Canada than in the United States (19%), France (19%) and the United Kingdom (18%), where the fertility rate is closer to the replacement level.

In addition, Canada is the G7 country with the largest proportion of working-age people, with 67.8% of its population in the 15-to-64 age group. The fact that the baby boom was greater in Canada than in most other G7 countries is behind the higher proportion of people in this age group. As all Canadian baby boomers reach the age of 65, the proportion of the working-age population in Canada will move closer to the levels observed in the other G7 countries.

### Text table 2.1 Age distribution of the population, Canada and other G7 countries, 2015

	0 to 14 years	15 to 64 years	65 years and over
	pe	rcent	
Canada	16.0	67.8	16.1
France	19	63	18
Germany	13	66	21
Italy	14	64	22
Japan	13	61	26
United Kingdom	18	65	17
United States	19	66	15

Note(s): Figures in percent may not add up to 100% as a result of rounding. Data for countries other than Canada are rounded to the unit as shown in the source used.

Source(s): International data come from the 2015 World Population Data Sheet of the Population Reference Bureau.

# 2.4 The population aging more slowly in the Prairie provinces and in the territories

At the provincial and territorial level, the proportions of people 65 years and older and children 0 to 14 years vary widely. In each of the eastern and central provinces and in British Columbia, the number of people 65 years and older was higher than the number of children 0 to 14 years on July 1, 2015. However, the Prairie provinces and the territories had more children aged 0 to 14 than people 65 years and older. In the 2008/2009 annual period, Nova Scotia and New Brunswick were the first two provinces where the proportion of people aged 65 and older exceeded the proportion of children aged 0 to 14 years.

<sup>2.</sup> Data of age distribution of the population for countries other than Canada are rounded to the unit as shown in the source used.

#### Chart 2.2

Proportion of the population aged 0 to 14 years and 65 years and over, 2015, Canada, provinces and territories

On July 1, 2015, New Brunswick was the province with the largest proportion of people aged 65 and older (19.0%), while Nunavut had the lowest proportion (3.7%), and Alberta the lowest proportion among the provinces (11.6%). Nunavut recorded the highest proportion of children aged 0 to 14 years (31.1%), while Nova Scotia had the smallest proportion (14.0%). Among the provinces, this proportion was highest in Saskatchewan (19.0%). Nationally, the ratio of persons 65 years and older to children aged 0 to 14 years was 1.01, indicating that the first group had a slightly higher demographic weight than the second. Nova Scotia had the highest ratio with 1.35 persons 65 years and older for every child aged 0 to 14. In contrast, Nunavut had 0.12 persons aged 65 and older for every child aged 0 to 14.

	Population	0 to 14 years	15 to 64 years	65 years and over	Median age

# Text table 2.2 Population estimates<sup>1</sup>, age distribution and median age as of July 1, 2015, Canada, provinces and territories

1. Preliminary postcensal estimates.

Note(s): Figures in percent may not add up to 100% as a result of rounding.

# 2.5 One Canadian in two is at least 40 years of age

In 2015, one Canadian in two was at least 40.5 years of age. The median age of Canada's population has risen by 5.7 years in the past 20 years (see Chart 2.3). The median age was higher for women (41.4 years) than for men (39.6 years). This difference is mainly attributable to a persistent, though shrinking, gap in life expectancy in favour of women. According to the latest data, life expectancy was 83.6 years for women and 79.3 years for men.<sup>3</sup>

# 2.6 The provinces with the highest and lowest median ages change over time

The median age varies considerably from province to province. On July 1, 2015, there was a difference

of 8.8 years between the provinces with the highest median age (45.0 years in Newfoundland and Labrador) and the lowest median age (36.2 years in Alberta). In 1995, the differences between the provinces were much smaller, with the gap at 2.8 years. The highest median age that year was 35.7 years in Quebec, and the lowest at 32.9 years in Alberta. The situation in Newfoundland and Labrador indicates an especially rapid aging of its population. In just over 20 years, Newfoundland and Labrador has gone from the province with the lowest median age (from 1971<sup>4</sup> to 1993) to the one with the highest (since 2005).

Among the territories, Nunavut continued to post the lowest median age at 25.8 years.

Median age, 1975 to 2015, Canada, provinces with lowest and highest median age

# 2.7 The number of centenarians continues to grow rapidly

Because of greater life expectancy and population aging, increasing numbers of Canadians are reaching the age of 100. On July 1, 2015, preliminary estimates indicate that there were almost 8,100 centenarians in Canada. or roughly 22 centenarians per 100,000 persons. In 2001,5 the proportion was half this number, at 11 centenarians per 100,000 persons. By comparison, in Japan-where the population is among the oldest in the world-there were about 50 centenarians per 100,000 persons in March 2015.<sup>6</sup> More women than men reach the age of 100 because of lower mortality rates than men at all ages. In 2015, most centenarians were women (88.4%).

# 2.8 The demographic dependency ratio is on the rise due to the increase in the population 65 years and older

The demographic dependency ratio represents the number of children (0 to 14 years) and seniors (65 and older) per 100 working-age persons (15 to 64 years). Over the last three decades (1980s, 1990s and 2000s), this ratio has remained relatively stable, reaching a low of 43.9 in 2007. Since the first baby boom generations began reaching the age of 65 in 2011, the demographic dependency ratio has been rising gradually.

On July 1, 2015, Canada's demographic dependency ratio was 47.4. In 1971, the first year of the period covered by the current system of demographic

 <sup>2001</sup> is the first year for which population estimates are available for centenarians.

Statistics Bureau of Japan. Population Estimates by Age (5 Year Age Group) and Sex - March 1, 2015 (Final estimates), August 1, 2015 (Provisional estimates). http://www.e-stat.go.jp/SG1/estat/ListE.do?lid=000001137580. Page visited on August 28, 2015.

accounts, this ratio was 59.5. However, that year, children (0 to 14 years) accounted for 78.5% of the

non-working-age population, compared with 49.9% in 2015.

#### Chart 2.4

### Demographic dependency ratio, 1971 to 2015, Canada

Because of the considerable size of their generation, baby boomers have always had a strong effect on the demographic dependency ratio. In 1971, when the youngest baby boomers were between the ages of 5 and 14, they accounted for 53.6% of the non-working-age population. From 1981 to 2010, all baby boomers were part of the population aged 15 to 64 and, given their significant demographic weight, they helped keep the demographic dependency ratio relative stable and low. Today, as baby boomers age, they are contributing to the rise in this ratio. This will continue until 2030, when the last baby boomers will turn 65. Based on the medium growth (M1) scenario of the most recent population projections, the demographic dependency ratio should reach 63.7 in 2030.

# 2.9 There are slightly more women than men in Canada

In addition to aging, the population's sex structure is changing (Chart 2.4). On July 1, 2015, the sex ratio for the Canadian population as a whole was estimated at 98.3 males per 100 females. This ratio has changed very little over the last 20 years, when it was 98.0 males per 100 females in 1995. Males outnumber females in the 0-to-14 and 15-to-39 age groups, because of the sex ratio at birth, which averages 105 males per 100 females. However, when people reach their mid-fifties, the number of men starts to fall slightly below the number of women because of a higher male mortality rate. This gap widens at more advanced ages: in the 65-to-79 age group, there were an estimated 91.1 males per 100 females This is an increase over 1995, on July 1, 2015. when there were 80.2 males for every 100 females. In the population 80 years of age and older, there were an estimated 62.8 males per 100 females on July 1, 2015, compared with 51.7 on July 1, 1995. The estimate for centenarians in 2015 was just 13.1 males per 100 females.

## Chart 2.5

### Sex ratio by age group, 1995 and 2015, Canada

number of males for 100 females

# 2.10 Slight differences in the sex ratios of the provinces and territories

The populations of the provinces and territories differ not only in their age structure, but also in their sex structure (Chart 2.6). On July 1, 2015, the sex ratio of the Atlantic provinces and Ontario was lower than that of Canada, while Nunavut had the highest ratio. Moreover, Saskatchewan and Alberta were the only two provinces with more men than women. This situation is mostly due to the higher sex ratio in their working-age populations, partly because interprovincial migration brings more men to these two provinces.

In the 0-to-14 age group, the sex ratio was higher than 1 in every Canadian province and territory because the number of boys born normally exceeds the number of girls born. In the population 65 years and older, the sex ratios ranged between 80 and 90 men per 100 women in all Canadian provinces. In Yukon and Nunavut, however, there were more elderly men than elderly women, partly because of the shorter life expectancy in these parts of Canada.

### Chart 2.6

number of males for 100 females

# 2.11 Migratory growth factors present a wide variety of age-sex structures

The components of migratory increase can also be described by their demographic structure. The age pyramid opposite (Figure 2.2) highlights the differences

in the age-sex structure of interprovincial migrants, immigrants,<sup>7</sup> non-permanent residents and the total population.

The interprovincial migrants and immigrants in question are persons who migrated between July 1, 2014 and June 30, 2015.

### Figure 2.2

The working-age population (15 to 64 years) constitutes a large proportion of each of the three migrant groups in question. The non-permanent resident subgroup comprises a significant proportion of young adults: 73.3% of them were between 15 and 34 years of age on July 1, 2015. The immigrant subgroup also largely consisted of adults, but they were slightly older. More than half (53.8%) of the immigrants who arrived in Canada during the last annual period were between 25 and 44 years old on July 1, 2015.

The immigrant population also differs from the non-permanent resident population by the significant proportion of children under the age of 15. Among immigrants, 18.6% were under 15 years, compared with 3.0% of non-permanent residents. The distinct age structure of non-permanent residents is mostly due to the fact that these persons come to Canada mainly to work and study, which mostly affects young adults and children less.

Young adults are also a significant proportion of the interprovincial migrant subgroup. During the most recent annual period, 45.4% of the individuals in this subgroup were between 15 and 34 years. Furthermore, people 65 years and older accounted for a larger proportion of interprovincial migrants (with 6.3% compared with 3.1% among immigrants and 0.6% of non-permanent residents) than international migrants.

Lastly, the sex structure of the three subgroups also differs. Males are slightly underrepresented among immigrants (92.3 males per 100 females), but are overrepresented among non-permanent residents (133.1 males per 100 females). By comparison, the sex ratio among the Canadian population as a whole is almost balanced, with 98.3 males per 100 females. These differences cannot be attributed to the effect of the different age structures because they are observed, to differing degrees, in most age groups, and not just in the total population.

#### Table 2.5-12 Annual<sup>1</sup> estimates of demographic components by age group and sex, Canada — Total net migration

1. Period from July 1 to June 30.

Note(s): Total net migration is updated from 2011/2012 to 2013/2014 and preliminary for 2014/2015.

# Methodology

This section describes the concepts, data sources and methodology used to produce the population estimates. Population estimates are produced to measure the population counts according to various characteristics and geographies between two censuses. The demographic estimates are the official population estimates at the national, provincial and territorial levels.

Postcensal estimates are based on the 2011 Census.

Specific information regarding age and sex distributions is provided in boxes.

# **Population Estimates**

# Estimates of the total population

#### Types of estimates

Population estimates can be either intercensal or postcensal. Intercensal estimates are produced using the counts from two consecutive censuses adjusted for census net undercoverage (CNU)<sup>1</sup> and postcensal estimates. The production of intercensal estimates involves updating the postcensal estimates using the counts from a new census adjusted for CNU.<sup>1</sup>

Postcensal estimates are produced using data from the most recent census adjusted for CNU<sup>1</sup> and the components of demographic growth. In terms of timeliness, postcensal estimates are more up-to-date than data from the most recent census adjusted for CNU,<sup>1</sup> but as they get farther from the date of that census, they become more variable.

#### Levels of estimates

Updating population estimates between censuses entails the use of data from administrative files or surveys. The quality of population estimates therefore depends on the availability of a number of administrative data files that are provided to Statistics Canada by Canadian and foreign government departments. Since some components are not available until several months after the reference date, three kinds of postcensal estimates are produced preliminary postcensal (PP), updated postcensal (PR) and final postcensal (PD). The time lag between the reference date and the release date is three months for preliminary estimates and two to three years for final estimates. Though it requires more vigilance on the part of users, the production of three successive series of postcensal estimates is the strategy that best satisfies the need for both timeliness and accuracy of the estimates. All tables indicate the level of the estimates they contain.

#### Calculation of postcensal population estimates

Population estimates – preliminary, updated and final – are produced by the component method. This method consists of taking the population figures from the most recent census, adjusted for the CNU<sup>1</sup> (census undercoverage minus census overcoverage), and adding or subtracting the number of births, deaths, and components of international and interprovincial migration.

<sup>1.</sup> In this case, the adjustment for the census net undercoverage also includes the incompletely enumerated Indian reserves (IEIR).

#### A. Provincial / territorial estimates of total population

Population estimates are produced for the provinces and territories first; then they are summed to obtain an estimate of the population of Canada.

The component-method formula for estimating the total provincial / territorial populations is as follows:

#### Figure 3

#### Component-method formula for estimating total population

 $P_{(t+i)} = P_{(t)} + B_{(t,t+i)} - D_{(t,t+i)} + I_{(t,t+i)} - [E_{(t,t+i)} + \Delta TE_{(t,t+i)}] + RE_{(t,t+i)} + \Delta Ninter_{(t,t+i)} + \Delta N_{(t,t+i)} - Resid_{(t,t+i)}$ 

#### where, for each province and territory:

(t, t+i)	=	interval between times t and t+i;
$P_{(t+i)}$	=	estimate of the population at time t+i;
$P_{(t)}$	=	base population at time t (census adjusted for (CNU) <sup>1</sup> or most recent estimate);
В	=	number of births;
D	=	number of deaths;
Ι	=	number of immigrants;
Ε	=	number of emigrants;
$\Delta TE$	=	net temporary emigration;
RE	=	number of returning emigrants;
$\Delta NPR$	=	net non-permanent residents;
$\Delta Ninter$	=	net interprovincial migration;
Resid	=	residual deviation (for intercensal estimates).

#### B. Provincial / territorial estimates by age and sex

Postcensal population estimates by age and sex are produced by applying the component method to each age-sex cohort in the base population.

At age 0:

#### Figure 4

#### Component-method formula for estimating population at age 0

 $P_{(t+1)}^{0} = B_{(t,t+1)} - D_{(t,t+1)}^{-1} + I_{(t,t+1)}^{-1} - \left[E_{(t,t+1)}^{-1} + \Delta T E_{(t,t+1)}^{-1}\right] \\ + R E_{(t,t+1)}^{-1} + \Delta N P R_{(t,t+1)}^{-1} + \Delta N inter_{(t,t+1)}^{-1} - Resid_{(t,t+1)}^{-1} + Resid_{(t,t+1)}$ 

From 1 to 99 years:

#### Figure 5

#### Component-method formula for estimating population from age 1 to 99

 $P_{(t+1)}^{a+1} = P_{(t)}^{a} - D_{(t,t+1)}^{a} + I_{(t,t+1)}^{a} - \left[E_{(t,t+1)}^{a} + \Delta T E_{(t,t+1)}^{a}\right] + R E_{(t,t+1)}^{a} + \Delta N P R_{(t,t+1)}^{a} + \Delta N inter_{(t,t+1)}^{a} - Resid_{(t,t+1)}^{a}$ 

For 100 years and over:

#### Figure 6

#### Component-method formula for estimating population at age 100 years and over

 $P_{(t+1)}^{100+} = P_{(t)}^{99+} - D_{(t,t+1)}^{99+} + I_{(t,t+1)}^{99+} - \left[ E_{(t,t+1)}^{99+} + \Delta T E_{(t,t+1)}^{99+} \right] \\ + R E_{(t,t+1)}^{99+} + \Delta N P R_{(t,t+1)}^{99+} + \Delta N inter_{(t,t+1)}^{99+} - Resid_{(t,t+1)}^{99+} \\ + R E_{(t,t+1)}^{99+} + \Delta N P R_{(t,t+1)}^{99+} + \Delta N P R_{(t,t+1)}^{99+} + \Delta N P R_{(t,t+1)}^{99+} + R R_{(t,t+1)}^{99+} \\ + R R_{(t,t+1)}^{99+} + R R_{(t,t+1)}^{99+}$ 

#### Figure 7

#### Legend for all ages

#### where, for each province and territory:

(t, t + 1)	=	interval between times t and t+1;
а	=	age;
$P_{(t+1)}$	=	estimate of the population at time t+1;
$P_{(t)}$	=	base population at time t (census adjusted for (CNU) <sup>1</sup> , or most recent estimate);
В	=	number of births;
D	=	number of deaths;
Ι	=	number of immigrants;
Ε	=	number of emigrants;
$\Delta TE$	=	net temporary emigration;
RE	=	number of returning emigrants;
$\Delta NPR$	=	net non-permanent residents;
$\Delta Ninter$	=	net interprovincial migration;
Resid	=	residual deviation (for intercensal estimates).

#### C. Levels of estimates

The difference between preliminary<sup>2</sup> and final postcensal population estimates lies in the timeliness of the components. When all the components are preliminary, the population estimate is described as preliminary postcensal (PP). When they are all final, the estimate is referred to as final postcensal (PD). Any other combination of levels is referred to as updated postcensal (PR).

#### Base population and components of demographic growth

#### A. Base population

The base populations are derived from the quinquennial censuses between 1971 and 2011. The population universe of the 2011<sup>3</sup> Census includes the following groups:

- Canadian citizens (by birth or by naturalization) and immigrants with a usual place of residence in Canada;
- Canadian citizens (by birth or by naturalization) and immigrants who are abroad either on a military base or attached to a diplomatic mission;
- Canadian citizens (by birth or by naturalization) and immigrants at sea or in port aboard merchant vessels under Canadian registry or Canadian government vessels;

<sup>2.</sup> Unless otherwise noted, the term preliminary include both preliminary and updated estimates

<sup>3.</sup> From 1991 to 2001 Census, "persons with a usual place of residence in Canada who hold Minister's permits (including extensions) and members of their families living with them" were included in the census universe.

- persons with a usual place of residence in Canada who are claiming refugee status and the family members living with them;
- persons with a usual place of residence in Canada who hold study permits and the family members living with them;
- persons with a usual place of residence in Canada who hold work permits and the family members living with them.

For census purposes, the last three groups are referred to as non-permanent residents (NPR). They have been included in the census universe since 1991 but foreign residents are not included. Foreign residents are persons who belong to the following groups:

- government representatives of another country attached to the embassy, high commission or other diplomatic body of that country in Canada, and members of their families living with them;
- members of the Armed Forces of another country who are stationed in Canada, and family members living with them;
- residents of another country visiting Canada temporarily (for example, a foreign visitor on vacation or on business, with or without a visitor's permit).

These base populations are adjusted as follows:

- adjustment of the population for CNU;
- addition of independent estimates for incompletely enumerated Indian reserves in 1991, 1996, 2001, 2006 and 2011;
- adjustment for early enumeration in 1991 and 1996 in parts of Northern Quebec, Newfoundland and Labrador, the Yukon and the Northwest Territories;
- addition of estimates of NPRs in 1971, 1976, 1981 and 1986. Since 1991, NPRs are included in the census universe;
- estimation of the July 1 base population by addition or subtraction of the components of growth between Census Day and June 30;
- demographic adjustment for old age population is an age structure adjustment of censal estimates for 2001, 2006 and 2011 by sex for each province and territory. These adjustments were performed from age 85 in 2001, from age 90 in 2006 and from age 95 in 2011.

Adjustment for the census net undercoverage (CNU)

The adjustment for CNU is important. CNU is the difference between the number of persons who should have been enumerated but were missed (undercoverage) and the number of persons who were enumerated but should not have been or who were counted more than once (overcoverage).

Coverage studies provide undercoverage estimates for the 1991, *1996*, *2001*, *2006* and *2011* censuses at the provincial and territorial levels, and for the 1971, 1976, 1981 and 1986 censuses at the provincial level only. Estimates of overcoverage at the provincial and territorial levels are available only for the last five censuses (1991, 1996, 2001, 2006 and 2011). Overcoverage for previous censuses was estimated by assuming that the overcoverage-to-undercoverage ratio for each census between 1971 and 1986 was the same as in 1991. The CNU for the Yukon and the Northwest Territories prior to 1991 was estimated by assuming that the ratio between the CNU for each territory and the 10 provinces for each census between 1971 and 1986 was the same as in 1991.

For consistency, the 1991 Census undercoverage and overcoverage were revised in 1998 to take into account the methodological improvements made in the 1996 Census coverage studies. This revision altered CNU in all censuses between 1971 and 1986. Similarly, the 1996 Census undercoverage and overcoverage were revised in 2003.

Various methods were used to produce the estimates of CNU by age and sex for 1991, 1996, 2001, 2006 and 2011. First, the national estimates of CNU based on the coverage studies by age and sex were smoothed. Then an Empirical Bayes regression model was used to generate the provincial and territorial estimates of CNU by broad age groups, and a synthetic model produced estimates by single year of age. Lastly, two-way raking<sup>4</sup> was used to ensure that CNU estimates were consistent with the provincial and territorial CNU totals and the national estimates by age and sex.

For the 1971 to 1986 period, CNU estimates by age and sex were simply prorated to the revised CNU estimates for the total population.

#### Demographic adjustment for old age populations

Age structure analysis of recent censuses and population estimates showed that population at old ages, especially centenarians (population aged 100 years old and over), have been subject to overestimation issues. For older populations, the types of errors and the magnitude of their effect can vary from one census to another, from error of misreporting (voluntary and non voluntary) to errors emerging from data capture and processing errors.

When compared to 2011 Census figures, estimates of centenarians still based on 2006 Census were 29% higher for females and 88% higher for males. This indicated that the adjustments done to diminish the 2006 base population for ages 95+, which would make the 100+ population in 2011, were not sufficient. This led the Population Estimates Program (PEP) of Statistics Canada to review its method to adjust the base population's age structure. For example, with these new adjustments, the number of centenarians has been lowered in 2006 for both male and female, respectively from 830 to 595 (-39%) and from 3,891 to 3,784 (-3%).

Using death data and a combination of two methods, the extinct cohort method and the survival ratios method for non-extinct cohorts, the PEP has adjusted the age structure of the 2011 Census population in order to overcome the overestimation of population at old ages observed in the 2006 cycle.

Assuming that these populations are not affected by migration, the principle of the extinct cohort method (Vincent, 1951) is simple. When all members of a given cohort have died (up until age 110), the numbers alive in a given year can be calculated by summing the deaths, beginning with the oldest. For non-extinct cohorts, the survival ratio method (Thatcher 1992; Thatcher and al. 2002; Andreev 2004) was used to estimate population in a similar way but under the assumption that deaths of non-extinct cohorts are distributed by age mainly like those who are extinct.

In order to assure coherence of estimates by cohort, the adjustment, name demographic adjustment, was produced to adjust censal estimates for 2001, 2006 and 2011 by age and sex for each province and territory. These adjustments were performed from age 85 in 2001, from age 90 in 2006 and from age 95 in 2011. The surplus populations among the oldest-old population were redistributed in population aged 5 to 74 years according to their relative weights for each province/territory and sex.

The robustness of this newly implemented method will be monitored through the 2011 cycle and researches to improve its fitness and coherence will be continued. A more complete description of the method will be incorporated in the first chapter (base population) of the methodological guide (catalogue no. 91-528-X) in the months to come.

4. Two-way raking is also referred to as the "Deming method", the "method of iterative proportions", and calibration (see Shryock, Siegel et al., 1976: 547-549).

#### B. Births and deaths

The numbers of births and deaths are derived directly from the vital statistics database of Statistics Canada's Health Statistics Division. Although Statistics Canada manages the National system of vital statistics, the central vital statistics registries of the provinces and territories are responsible for collecting and processing the information from those administrative files. Under provincial / territorial vital statistics statutes (or similar legislation), all live births and all deaths must be registered, and all provinces and territories provide this information to Statistics Canada.

The vital statistics universe closely parallels the census universe. Both universes include the births and deaths of all Canadians, immigrants and non-permanent residents (NPR) and exclude foreign residents.

Vital statistics by province or territory of residence are used to produce our final estimates of births and deaths.

When there are no vital statistics, the number of births is estimated using fertility rates by the mother's age. The number of deaths is estimated by using mortality rates by age and sex. These methods are used to calculate preliminary<sup>2</sup> estimates.

Special treatment for preliminary<sup>2</sup> estimates for Quebec and British Columbia

Quebec and British Columbia provide their most recent estimates of births and deaths. The figures are used to produce preliminary<sup>2</sup> estimates. For the final estimates, the two provinces' births and deaths are derived from the vital statistics compiled by Health Statistics Division.

With regard to the preliminary<sup>2</sup> estimates, the number of births by sex is derived by applying an average proportion by sex for each province and territory to the births derived from the birth probabilities. These proportions are calculated using vital statistics from the past 10 years.

With regard to the preliminary<sup>2</sup> estimates, the number of deaths by age and sex is derived by applying mortality rates by age and sex for each province and territory to the deaths derived from the death probabilities. These mortality rates are calculated using vital statistics from the past 2 years.

#### Levels of estimates

For information on the differences between preliminary<sup>2</sup> and final estimates, see sections **B. Births and Deaths**, above.

#### C. Immigration

Like the numbers of births and deaths, Canadian immigration statistics must be kept by law. In Canada, immigration is regulated by the Immigration and Refugee Protection Act (IRPA) of 2002. This statute superseded the Immigration Act, which was passed in 1976 and amended more than 30 times in the years thereafter. Citizenship and Immigration Canada (CIC) collects and processes immigrants' administrative files. It then provides Statistics Canada with information from Field Operational Support System (FOSS) files. CIC is currently transitioning towards a new system: the Global Case Management System (GCMS). The information is used to estimate the number and characteristics of people granted permanent resident status by the federal government on a given date. For Demography Division, the terms immigrant and permanent resident are equivalent.

An immigrant is a person who is not a Canadian citizen by birth, but has been granted the right to live in Canada permanently by Canadian immigration authorities. The number of immigrants does not include persons born abroad to Canadian parents who are only temporarily outside the country.

Immigrants are usually counted on or after the date on which they are granted permanent resident status or the right to live in Canada.

The number of immigrants by age and sex is derived from the Field Operational Support System (FOSS).

#### Levels of estimates

The difference between preliminary<sup>2</sup> and final postcensal estimates lies in the timeliness of the source used to estimate this component. Since the FOSS files are continually being updated, new calculations are carried out each year to update the immigration estimates. Immigration estimates are preliminary the first year and final the following year.

#### D. Net non-permanent residents

Like the numbers of births and deaths, Canadian immigration statistics must be kept by law. In Canada, the non-permanent residents (NPR) are regulated by the *Immigration and Refugee Protection Act* (IRPA) of 2002. This statute superseded the *Immigration Act*, which was passed in 1976 and amended more than 30 times in the years thereafter. Citizenship and Immigration Canada (CIC) collects and processes the administrative files of immigrants and NPRs in Canada. It then provides Statistics Canada with information from Field Operational Support System (FOSS) files. CIC is currently transitioning towards a new system: the Global Case Management System (GCMS). The information is used to estimate the number and characteristics of people granted non-permanent resident status by the federal government.

NPRs are persons who are lawfully in Canada on a temporary basis under the authority of a temporary resident permit, along with members of their family living with them. NPRs include foreign workers, foreign students, the humanitarian population and other temporary residents. The humanitarian population includes refugee claimants and temporary residents who are allowed to remain in Canada on humanitarian grounds and are not categorized as either foreign workers or foreign students. For Demography Division, the terms non-permanent resident and temporary resident are equivalent.

NPR estimates are based on the number of NPRs, not on the net. The number of people in CIC's administrative system is estimated on a specific date in each period of observation. First, the end-of-period number of NPR is estimated, and then the start-of-period number of NPR is subtracted from that estimate. That yields the net number of NPR.

Anyone who received non-permanent resident status prior to the observation date is counted. For refugee claimants, the date of their application is used. Permit holders and refugee claimants are excluded from the population if their permit has expired, if they receive permanent resident status, or if they are deported. In addition, refugee claimants are excluded if their file has been inactive for two years.

Since FOSS files are continually being updated, the figures are recalculated each year until the estimates of net NPR are final.

The net number of non-permanent residents by age and sex is derived from the Field Operational Support System (FOSS).

#### Levels of estimates

The difference between preliminary<sup>2</sup> and final estimates lies in the timeliness of the source used to estimate this component. Since the FOSS files are continually being updated, the figures are recalculated each year to update the estimates of the net number of NPRs. Non-permanent resident (NPR) estimates are preliminary the first year and updated the following year. They become final two to three years after the reference year, when all other components are also final.

#### E. Emigration

The number of emigrants is estimated using data from the Office of Immigration Statistics, U.S. Department of Homeland Security, data collected by the Canada child tax benefit (CCTB) program, and data from the T1 Family File (T1FF).<sup>5</sup> The first source is used to estimate emigration to the United States. CCTB data are used to estimate emigration to other countries. The estimates of the number of child emigrants have to be adjusted because the CCTB is not universal and does not provide direct information on the number of adult emigrants. As a result, four adjustment factors are taken into account:

- incomplete coverage due to a delay in the receipt and processing of the files of children eligible for the CCTB. Since it seems to take four years after the reference period for CCTB administrative files to become complete, the adjustment is made when the estimates are used before this date. The factor is derived from the two-year ratios of emigrant children based on two versions of the CCTB files;
- the program's partial coverage, that is, people who do not apply for the CCTB or who are not eligible. This factor
  is obtained by comparing the estimated number of children in the population with the number of children in CCTB
  files;
- the differential propensity to emigrate between children who are eligible for the CCTB and children who are not. This factor is obtained by comparing the emigration rates of CCTB-eligible children with the rates for all children (aged 0 to 17). This factor is calculated for each province and territory and is based on the last three available years of T1FF;<sup>5</sup>
- the differential propensity to emigrate between adults and children. This factor generates the emigration rate for the population aged 18 and over. It is obtained by (1) calculating the average ratio over three years of the adult and child emigration rates based on T1FF<sup>5</sup> data, (2) calculating the average ratio over three years of the adult and child emigration rates based on data from the Office of Immigration Statistics, U.S. Department of Homeland Security, and (3) taking the average of the two rates. This factor is calculated for Canada only.

The adult emigration rate is applied to the adult population. Adult emigration is distributed by province and territory using data from the T1FF<sup>5</sup> file. We calculate a ratio of the number of emigrant adults to the number of emigrant children from the T1FF<sup>5</sup> file. We then apply this ratio to the number of emigrant children from the CCTB by province, which yields the number of adult emigrants whose provincial distribution will differ from that of the children.

The number of adult emigrants combined with the number of child emigrants (once adjusted for the coverage and differential emigration factors) generate the number of emigrants for the entire population.

Emigration is disaggregated by province and territory based on the number of child emigrants adjusted for coverage and differential emigration.

Estimates of the number of emigrants by age and sex are obtained by using the data by five-year age group, sex, province and territory from T1FF<sup>5</sup> files adjusted for the coverage. We distribute these estimates by single year of age using Sprague coefficients.

Levels of estimates

The difference between preliminary<sup>2</sup> and final estimates lies in the timeliness of the sources used to estimate this component. The same estimation method is used.

<sup>5.</sup> The T1 family file (T1FF) is derived from the Canada Revenue Agency (CRA) T1 file by Income Statistics Division of Statistics Canada.

#### F. Net temporary emigration

Some people leave Canada to live temporarily in another country while others who were temporarily outside of Canada return. The net result of those departures and returns is the component known as "net temporary emigration". Estimates of the number of departures are derived from the Reverse Record Check (RRC), the most important census coverage study. The RRC provides an estimate of the number of people who left Canada temporarily during an intercensal period and are still out of the country at the end of the period. Estimates of the number of returns are based on two sources: the census and Demography Division's estimates of returning emigrants. The census provides the number of people who were outside Canada at the time of the previous census and returned during the intercensal period. That number includes all returning emigrants. Then Demography Division's estimate of the returning emigrants component is subtracted to produce the number of returning temporary emigrants. The estimated numbers of departures (RRC) and returns (census and Demography Division) yield an estimate of net temporary emigration.

This estimate is for the whole intercensal period; it is disaggregated into estimates for each of the five years in the period and then into monthly estimates using a seasonal adjustment that is an average between zero seasonality and the seasonality of emigration.

Net temporary emigration is calculated first for the national level. It is then disaggregated by province or group of provinces based on RRC estimates of temporary emigration. For the Atlantic provinces and the territories, the estimate for the group is disaggregated on the basis of each province / territory's proportion of the group's total population.

Net temporary emigration can be estimated only for the intercensal period preceding the most recent census. Net temporary emigration in the current period is assumed to be the same as in the previous period for each province and territory.

The emigration age and sex distribution is applied to obtain the age and sex structure of the net temporary emigration.

#### Levels of estimates

The difference between preliminary<sup>2</sup> and final estimates lies in the timeliness of the emigration estimate used to calculate the seasonal adjustment for the net temporary emigration. The same estimation method is used.

#### G. Returning emigrants

A returning emigrant is a person who returns to Canada after having been classified as an emigrant. In a manner similar to the procedure used to calculate the number of emigrants, data from the Canada child tax benefit (CCTB) file from Canada Revenue Agency (CRA) and T1FF<sup>5</sup> file are used to estimate the number of returning emigrants. Adjustment factors are applied to compensate for the fact that the CCTB program is not universal, and an adult/child ratio is used to estimate the number of adult returning emigrants. As a result, four adjustment factors are used to take into account:

- incomplete coverage due to a delay in the receipt and processing of the files of children eligible for the CCTB. Since it seems to take four years after the reference period for CCTB administrative files to become complete, the adjustment is made when the estimates are used before this date. The factor is derived from the two-year ratios of returning emigrant children based on two versions of the CCTB files;
- the program's partial coverage, that is, people who do not apply for the CCTB or who are not eligible. This factor
  is obtained by comparing the estimated number of children in the population with the number of children in CCTB
  files;

- the differential propensity to emigrate between children who are eligible for the CCTB and children who are not. This factor is obtained by comparing the emigration rates of CCTB-eligible children with the rates for all children (aged 0 to 17). This factor is calculated for each province and territory and is based on the last three available years of T1FFs;<sup>5</sup>
- the adult / child ratio, which is based on the 2011 National Household Survey.

The age and sex distribution of returning emigrants is based on the National Household Survey (NHS) data Characteristics of returning emigrants are derived from the question on the place of residence one year ago, after excluding non-permanent residents and immigrants.

#### Levels of estimates

The difference between preliminary<sup>2</sup> and final estimates lies in the timeliness of the sources used to estimate this component. The same estimation method is used.

#### H. Interprovincial migration

Interprovincial migration represents movements from one province or territory to another, involving a change in usual place of residence. As is the case for emigration, there is no provision for recording interprovincial migration in Canada. Consequently, such movements have to be estimated using data from the Canada child tax benefit (CCTB) of Canada Revenue Agency (CRA) and T1FF.<sup>5</sup>

Final estimates of interprovincial migration are obtained by comparing addresses indicated on personal income tax returns over two consecutive tax years. However, the migration status of tax filers' dependants has to be imputed. An adjustment is also required to take into account migrants who do not file income tax returns. From 2001/2002 to 2005/2006, the adjustment was slightly modified (for further information, see *Wilkinson, 2004*). From 2006/2007, this adjustment has been slightly modified (Cyr, 2008 – Internal document).

Since income tax returns are not available at the time preliminary estimates are produced, the estimation of preliminary<sup>2</sup> interprovincial migration is based on CCTB administrative files, which provide counts of child migrants (aged 0 to 17) registered to the program. The estimates have to be adjusted later for children who are not registered to the CCTB program. Finally, the number of adult migrants is calculated using the number of child migrants and factors derived from the T1FF.<sup>5</sup> As a result, three adjustment factors are used to take into account:

- the program's partial coverage, that is, people who are not registered to the CCTB program. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;
- the differential propensity to migrate between children who are registered to the CCTB program and children who
  are not. This factor is obtained by comparing the out-migration rates of children registered to the CCTB program
  with the rates for all children (aged 0 to 17). This factor is calculated for each province and territory and is based
  on the last available year of T1FF;<sup>5</sup>
- the differential propensity to migrate between adults and children. This factor generates the out-migration rate of the population aged 18 and over for each province / territory of origin and destination. It is obtained by calculating the ratio of the central migration rate for adults to the rate for children. It is estimated using data from the last three available years of T1FF.<sup>5</sup>

The adult migration rate is then applied to the estimated adult population. The number of adult migrants is then added to the number of child migrants to produce the number of interprovincial migrants for the entire population.

Along with the July 1, 2015 population estimates, the method to estimate the interprovincial migration has been modified. This new method is applied from July 2011 onward. In order to reduce the differences between the preliminary annual series (which was derived from the sum of 12 monthly migration matrices) and the final annual series, CCTB microdata have been used. Using microdata is allowing estimating migration for various periods (monthly, quarterly and annually). It allows improving the comparability between preliminary and final estimates. Final annual estimates (T1FF) are now distributed by quarter on the basis of preliminary quarterly estimates derived from CCTB microdata. It is important to note that, as a result of using CCTB microdata, it is not possible to add the quarterly interprovincial in-migrants and out-migrants estimates to get the annual estimates. It is however possible to add the quarterly net interprovincial migration estimates to get the annual estimates.

Interprovincial migration by age and sex is derived from T1FF<sup>5</sup> data and counts derived from the NHS question on the place of residence one year ago. From 2011/2012, the 2011 NHS age and sex distribution is used.

#### Levels of estimates

For information on the differences between preliminary<sup>2</sup> and final estimates of total interprovincial migration, see section **H. Interprovincial migration** above.

#### Intercensal population estimates

Intercensal estimates – population estimates for reference dates between two censuses – are produced following each census. They reconcile previous postcensal estimates with the new census counts.

There are two main steps in the production of intercensal estimates:

- · calculation of the error of closure;
- linear distribution of the error of closure.

The error of closure is defined as the difference between the postcensal population estimates on Census Day and the population enumerated in that census adjusted for CNU.<sup>1</sup>

The error of closure is spread uniformly over the intercensal period of days within each month.

Intercensal estimates by age and sex are adjusted in the same way, i.e., by distributing the error of closure uniformly across the age-sex cohorts.

# **Quality of demographic data**

The estimates contain certain inaccuracies stemming from two types of errors:

- · errors in the census data;
- imperfections in other data sources and the method used to estimate the components.

# Census data

#### A. Coverage, response and imputation errors

The errors attributable to census data can be divided into two groups: response and processing errors, and coverage errors. The first group implies non-response error, misinterpretation by respondents, incorrect coding and non-response imputation. Errors in the second group primarily result from undercoverage and, to a lesser extent, overcoverage. It should be noted that both types of errors are intrinsic to any survey data.

The coverage errors occur when dwellings and/or individuals are missed, incorrectly included (except for the 2006 and 2011 censuses, where people incorrectly included were not considered in the Census Overcoverage Study) or counted more than once. Following each census, Statistics Canada undertakes coverage studies to measure these errors. The main studies are the Reverse Record Check Survey (RRC) and the Census Overcoverage Study (COS). Based on these studies, estimates of census undercoverage and overcoverage are produced. Demography Division adjusts the population enumerated in the census by province and territory using these estimates.

When creating base populations, the Estimates Program corrects the census populations only for coverage errors. This correction, which is based on the findings of coverage studies, is primarily subject to sampling errors, and to a lesser extent, processing errors. Statistical tests indicate that coverage adjustments improve the quality of census data. The Estimates Program uses the estimates from coverage studies for the provinces and territories. However, given the size of the samples in these studies, estimates by age and sex are modelled. Furthermore, it is assumed that the coverage rates estimated for a province or territory apply to the regions within that geographic area. Prior to 1991, the Estimates Program used census data that was unadjusted for coverage errors. Coverage studies had been done to measure undercoverage, but none measured overcoverage. Following the decision to integrate a correction for the coverage to the enumerated population in 1991, the Program had to revise the population estimates for the period from 1971 to 1986. The correction is based on the findings of the coverage studies conducted during this period and on hypotheses regarding the ratio between the overcoverage and undercoverage levels based on the findings of subsequent coverage studies.

The corrections to the census data due to CNU improved, in general, the quality of the estimates by compensating for the differential undercoverage by age, sex and by province/territory across censuses.

#### Text table 1

1. The levels and rates are based on the Reverse Record Check (RRC) and the Overcoverage Study and include non-permanent residents.

The adjustment also incorporates the results of a study on the estimates of the number of people living on incompletely enumerated Indian reserves to complete the corrections for coverage errors in the census. The results of the coverage studies contain mainly sampling errors.

These adjustments have a direct impact on:

- the error of closure and its distribution by age and sex within a province or a territory as well as by province/territory as the CNU<sup>1</sup> and its distribution vary from one census to another;
- within-cohort consistency of population estimates. If for example, the male cohort in age group 0 to 4 in 1981 was
  tracked up to the 2001 Census (unadjusted for CNU)<sup>1</sup> the age group 20 to 24 would be noticeably smaller
  in 2001 than the age group 15 to 19 in 1996. Since Canada receives many immigrants within these age
  groups, the opposite would be expected. However, only after adjustment for CNU,<sup>1</sup> the cohort size increases
  from 1996 to 2001.

	2001	2006	2011

#### Census adjustment rates by age group, 2001, 2006 and 2011 censuses, Canada

Note(s): The census adjustment represents the sum of census net undercoverage, incompletely enumerated Indian reserves and demographic adjustment.

For further information regarding the main coverage studies, please see the following document on Statistics Canada's web site: 1996, 2001, 2006 and 2011 Census Technical Report on Coverage.

# Components

Text table 2

Errors due to estimation methodologies and data sources other than the census can also be significant.

#### A. Births and deaths

Since the law requires the recording of vital statistics, the final estimates for births and deaths data meet very high standards. Nevertheless, since preliminary estimates are derived, they can be slightly different from final estimates.

#### B. Immigration and non-permanent residents

With respect to immigrants and non-permanent residents, Citizenship and Immigration Canada (CIC) administers special data files on both of these components. Since immigration is controlled by law, data on immigrants and NPRs are compiled upon arrival in Canada. These data represent only "legal" immigration and exclude illegal immigrants. Thus, for the "legal" part of international movement into Canada, the data are considered to be of high quality. However, some biases such as the difference between the stated province of intended residence at the time of arrival and the actual province of residence, may persist. Finally, since information provided by the Visitor Data System (VDS) from (CIC) is not complete (age and sex of dependents, province of residence for certain groups of permit holders), estimates of NPRs are more prone to error than data on immigrants.

# C. Emigration, returning emigration and net temporary emigration

Of all the demographic components that are used in the population estimates program, the emigration, returning emigration and net temporary emigration are the most difficult to estimate with precision. Canada does not have a complete border registration system. While immigration and non-permanent residents (NPRs) are well documented by the federal government, Statistics Canada has always used indirect techniques for the estimation of the number of persons leaving the country. For this reason, available statistics regarding these three components have historically been of a lower quality than other components.

Estimates of the number of emigrants and returning emigrants are both derived using Canada child tax benefit (CCTB) data provided by Canada Revenue Agency (CRA). Estimates must be adjusted to take into account the incomplete coverage of the program and to derive the emigration and returning emigration of adults.

These adjustments and the delay in obtaining the data are the two main sources of errors. As current information on the number of persons living temporarily abroad does not exist, estimates are based on the Reverse Record Check (RRC) and the census. Estimates for the intercensal period, distributed equally among the five years, are maintained constant for the postcensal period. Moreover, assumptions were made to allow for the distribution of annual estimates to a quarterly level. Any geographical or quarterly variation may introduce error in the estimation of these components.

#### D. Interprovincial migration

Since July 1993, preliminary<sup>2</sup> interprovincial migration estimates have been based on Canada child tax benefit (CCTB) files. As this program covers only children, various adjustments must be done in order to derive the migration of adults. Consequently, preliminary CCTB based estimates are subject to larger error than final estimates derived from Canada Revenue Agency (CRA) tax files.

#### E. Level of detail of components

As a more detailed breakdown of the data introduces a greater risk of inaccuracy into the estimates, the possibility of error in the components is augmented by the method used to distribute the estimates by age and sex. It seems that, in general, the initial errors should be minimal where the distribution of annual estimates of births, deaths and immigrants is concerned, and more significant with regard to the distribution of other components (non-permanent residents, emigrants, returning emigrants, net temporary emigrants and interprovincial migrants). Finally, the size of error due to the age and /sex distribution may vary by period and errors in some components may have a greater impact on a given age group or sex.

# **Quality assessment**

In order to assess the quality of our estimates, two evaluation measures are used: precocity errors and errors of closure.

#### A. Precocity error

The quality of preliminary estimates of components is evaluated using precocity errors. Precocity error is defined as the difference between preliminary and final estimates of a particular component in terms of its relative proportion of the total population for the relevant geographical area. It can be calculated for both population and component estimates. The precocity error measures the impact of the trade-off of accuracy in favour of timeliness on the estimated population. The annual precocity error of a component is calculated as:

#### Figure 8

#### **Precocity error**

$$PE_{(t-1,t)} = \frac{\left(N_{(t-1,t)}^{preliminary} - N_{(t-1,t)}^{final}\right)}{P_{t-1}} \times 1,000$$

where,

 $\begin{array}{ll} PE_{(t-1,t)} & = \mbox{the precodity error for the period from t-1 to t;} \\ N_{(t-1,t)}^{preliminary} & = \mbox{the preliminary estimate of a component of demographic change;} \\ N_{(t-1,t)}^{final} & = \mbox{the final estimate of a component of demographic change;} \\ P_{t-1} & = \mbox{estimated population for the relevant geographical area at time t-1.} \end{array}$ 

Precocity error allows for useful comparisons between components, as well as between provinces and territories or geographical areas of different population size. Precocity error can either be positive or negative. A positive precocity error denotes that the preliminary estimate is larger than the final estimate while a negative precocity error indicates the opposite.

#### Precocity error by component for Canada

At the national level, immigration component yielded the smallest precocity errors,<sup>1</sup> with values close to zero per thousand throughout the years under consideration. On the other hand, interprovincial in-migrants and out-migrants<sup>2</sup> yielded the greatest precocity errors, ranging between 0.92 per thousand and 2.24 per thousand during the period 2010/2011 to 2013/2014 (see Text table 3).

<sup>1.</sup> As precocity errors can either be positive or negative, the following discussion of precocity errors is based on absolute values.

<sup>2.</sup> At the national level, net interprovincial migration equals to zero as the sum of interprovincial in-migrants is equivalent to the sum of interprovincial out-migrants across provinces and territories.

#### Text table 3

#### Most up-to-date annual precocity errors for components, Canada, provinces and territories

Precocity errors for births were mostly small when compared to other components, with the largest precocity error of -0.29 per thousand in 2007/2008. Similar to births, precocity errors for deaths were also low, with values lower or equal to 0.31 per thousand.

Precocity errors for emigration and returning emigration were mostly negative, i.e. preliminary estimates were smaller than final estimates. During the years under consideration, precocity error for emigration was lowest in 2009/2010 at 0.05 per thousand and largest in 2007/2008 at -0.48 per thousand. For returning emigration, the values ranged from -0.20 per thousand in 2008/2009 to -0.33 per thousand in 2007/2008 and 2010/2011. During the period 2007/2008 to 2010/2011, the precocity errors for net temporary emigration were positive and low, at 0.05 per thousand throughout those years.

Precocity errors for net non-permanent residents were negative and low during the period under consideration. From 2007/2008 to 2009/2010, precocity errors were stable at -0.04 per thousand and increased slightly to -0.08 per thousand in 2010/2011.

#### Precocity error by component for provinces and territories

In general, precocity error is typically larger for smaller provinces or territories as it is an error measurement relative to population size. At the provincial and territorial level, precocity errors for births were small and mostly negative, ranging from close to 0.0 per thousand (Quebec in 2009/2010)<sup>3</sup> to -1.67 per thousand (Nunavut in 2009/2010). Similar to births, precocity errors for deaths were also low but predominantly positive. Over the years, the largest precocity error for deaths was 1.03 per thousand (Northwest Territories in 2010/2011).

Compared to other demographic components, precocity errors for immigration were low among the provinces and territories, with absolute error values no more than 0.15 per thousand over the current years. The net change in the number of non-permanent residents was another component that yielded small precocity errors, with absolute error values less than 0.42 per thousand across the provinces and territories.

Precocity errors for emigration ranged from the lowest at 0.01 per thousand (Saskatchewan in 2007/2008) and -0.01 per thousand (New Brunswick in 2009/2010) to the largest at -1.56 per thousand (Northwest Territories in 2007/2008). Precocity errors for returning emigration were mostly negative; the values ranged from around zero per thousand for some years in the three territories to -0.74 per thousand for Yukon in 2009/2010. Precocity errors for net temporary emigration were positive during the years under consideration, except for British Columbia (2007/2008 to 2010/2011) and the Northwest Territories (2008/2009 to 2010/2011 only).

Precocity errors for interprovincial in-migrants and out-migrants show that final estimates of these components were systematically lower than preliminary estimates (with four exceptions for in-migrants and one exception for out-migrants).

At the provincial level, the largest absolute precocity error value for net interprovincial migration was -4.62 per thousand (Newfoundland and Labrador in 2013/2014), while the smallest was 0.04 per thousand (Ontario in 2013/2014). Precocity errors for net interprovincial migration for Alberta, the gainer in net interprovincial migration in recent years, ranged from a low of 0.14 per thousand in 2011/2012 to a high of 3.62 per thousand in 2012/2013.

#### Contribution of components to the sum of precocity errors

When looking at aggregated estimates of precocity errors, there is the potential for a "netting-out" effect, referring to negative precocity errors in one component canceling out positive errors in another component. The analysis of the contribution of each component to the sum of precocity errors without the netting-out effect can be done by using absolute values of the precocity errors. A mean absolute percentage precocity error by component is calculated by dividing the mean absolute precocity error by component by its sum and expressed in percentages. In this case, the mean absolute precocity error by component is the mean of the absolute precocity errors for the 2006/2007 to 2010/2011 period.

At the national level, the mean absolute precocity error for the total emigration<sup>4</sup> component contributed the most to the sum of mean absolute precocity errors (62.37%), followed by births (15.22%) and deaths (13.89%), between 2006/2007 and 2010/2011. Immigration and net non-permanent residents each accounted for less than 9.0% to the sum of mean absolute precocity errors (refer to Text table 4).

<sup>3.</sup> As mentioned in the Methodology Section, the provincial statistical agencies of Quebec and British Columbia provide their most recent estimates of births and deaths to Statistics Canada. The figures are used to produce preliminary estimates.

<sup>4.</sup> Mean absolute percentage precocity error for total emigration includes the mean absolute percentages for emigration, returning emigration and net temporary emigration.

Text table 4

#### Mean absolute percentage precocity error by components, 2006/2007 to 2010/2011, Canada, provinces and territories

	Births	Deaths	Immigration	Total <sup>1</sup> emigration	Net non-permanent residents	Net interprovincial migration	Total

Saskatchewan	12.96	6.45	1.28	15.04	0.89	63.38	100.00					
Alberta	12.86	5.44	2.18	22.55	4.55	52.42	100.00					
British Columbia	1.15	1.75	1.22	66.54	0.79	28.55	100.00					
Yukon	6.63	5.03	1.10	8.22	3.10	75.91	100.00					
Northwest Territories	6.45	3.86	0.53	13.23	2.18	73.75	100.00					
Nunavut	8.53	3.52	0.41	6.96	1.16	79.43	100.00					

1. Total emigration includes emigration, returning emigration and net temporary emigration.

At the provincial and territorial level, the contribution of individual component to the sum of mean absolute precocity errors was not uniform across the country. Net interprovincial migration accounted for the largest share of the sum of mean absolute precocity errors in ten out of the thirteen provinces and territories, ranging from 35.30% in New Brunswick to 79.43% in Nunavut. In Quebec, Ontario and British Columbia, total emigration contributed the most to the sum, with 56.59%, 47.96% and 66.54%, respectively (refer to Text table 4).

On the other hand, births accounted for the smallest share of the sum of mean absolute precocity errors in Quebec, at 1.92%. Between 2006/2007 and 2010/2011, net non-permanent residents accounted for the smallest share of the sum of mean absolute precocity errors in Newfoundland and Labrador (1.02%), Prince Edward Island (1.63%), New Brunswick (0.42%), Saskatchewan (0.89%) and British Columbia (0.79%). For the rest of the provinces and territories, the contribution of immigration to the sum was the smallest, at 2.18% or below.

Precocity errors by age and sex are not currently available.

#### **B. Error of closure**

The error of closure measures the exactness of the final postcensal estimates. It is defined as the difference between the final postcensal population estimates on Census Day and the enumerated population of the most recent census adjusted for census net undercoverage (CNU<sup>1</sup>). A positive error of closure means that the postcensal population estimates have overestimated the population.

The error of closure comes from two sources: errors primarily due to sampling when measuring census coverage and errors related to the components of population growth over the intercensal period. For each five-year intercensal period, the error of closure can only be calculated following the release of census data and estimates of CNU<sup>1</sup>. The error of closure can be calculated for the total population of each province and territory as well as by age and sex.

Text table 5 shows postcensal population estimates on May 10, 2011 and census counts adjusted for CNU<sup>1</sup> and the errors of closure for Canada, provinces and territories for 2001, 2006 and 2011.

For Canada as a whole, the error of closure was estimated at 171,115 or 0.50% in 2011. This is an increase over the errors for 2001 (0.16%) and 2006 (0.14%).

#### Annual Demographic Estimates: Canada, Provinces and Territories

The population estimates overestimated the population of six provinces, two territories and Canada as a whole. Four provinces and two territories posted errors of closure greater than 1% or less than -1%. Of these jurisdictions, only Newfoundland and Labrador's estimated population differed from the adjusted census population by more than 2% (-2.09%). In 2006, two provinces and three territories posted errors of closure greater than 1% or less than -1%, while this was the case for three provinces and two territories in 2001.

By considering the variance in CNU, it is possible to identify errors of closure that are statistically significant. Text table 5 shows the results of this analysis.

The error of closure is statistically significant for Canada, five provinces and one territory. This means that the population estimates significantly overestimated or underestimated the adjusted census population in these jurisdictions. As noted above, these results are due to both the sampling for census coverage studies and errors in the components of population growth over the intercensal period. Among these components, interprovincial migration and emigration are mostly associated with large errors of closure.

1. Census net undercoverage includes the incompletely enumerated Indian reserves.

Census net undercoverage excludes the incompletely enumerated Indian reserves.
 An error of closure with a t value greater than 1.96 or less than -1.96 is statistically significant at the 95% confidence level.

The error of closure can be calculated for total population estimates and for age and sex.

# Glossary

# Age

Age as of July 1.

# Ageing (of a population)

An increase in the **number of old persons** as a percentage of the total population.

# Average age

The average age of a population is the average age of all its members.

# Census coverage

Census net undercoverage: Difference between undercoverage and overcoverage.

**Overcoverage**: Number of persons who should not have been counted in the census or who were counted more than once.

Undercoverage: Number of persons who were intended to be enumerated in a census but were not.

# Cohort

Represents a group of persons who have experienced a specific demographic event during a given year. Thus, the married cohort of 2001 consists of the number of persons who got married in 2001. In the cast of births, persons born within a specified year are referred to as a generation.

# Components of demographic growth

Any of the classes of events generating population movement variations. Births, deaths and migrations are the components responsible for the variation since they alter either the total population or the age and sex of the population.

# Dependency ratio

The ratio of the combined population aged from 0 to 14 years old and the population aged 65 years and over to the population aged from 15 to 64 years old.

# Emigrant

Canadian citizen or immigrant who has left Canada to establish a permanent residence in another country.

# **Error of closure**

Difference between the **postcensal estimate** at the census date and the results of the census adjusted for **census net undercoverage** (including adjustment for incompletely enumerated Indian reserves).

# Generation

Unless otherwise specified, refers here to a group of persons born within a given period. The 2001 generation represents people born during the year 2001.

# Immigrant

Within the framework of this publication, the term immigrant refers to **landed immigrant**. An immigrant is a person who does not have Canadian citizenship but was granted the right by the immigration authorities to live in Canada on a permanent basis.

# International migration

International migration represents movement of population between Canada and a foreign country which involves a change in the usual place of residence. A distinction is made with regard to **immigrants**, **emigrants**, **returning emigrants**, **net temporary emigrants** and **net non-permanent residents**.

# Interprovincial migration

Interprovincial migration represents movement between provinces or territories involving a change in the usual place of residence. A person who takes up residence in another province or territory is an **out-migrant** with reference to the province or territory of origin and an **in-migrant** with reference to the province or territory of destination.

# Median age

The median age is an age "x", such that exactly one half of the population is older than "x" and the other half is younger than "x".

# Natural increase

Variation in the population size over a given period as a result of the difference between the numbers of births and deaths.

# Net international migration

Net international migration is obtained according to the following formula: **Immigrants + returning emigrants + net non-permanent residents - (emigrants + net temporary emigrants)**.

# Net interprovincial migration

Net interprovincial migration represents the difference between **in-migrants** and **out-migrants** for a given province or territory.

#### Net non-permanent residents

Net non-permanent residents represent the variation in the number of non-permanent residents between two dates.

#### Non-permanent residents

A non-permanent resident belongs to one of the five following groups:

persons with a usual place of residence in Canada who are claiming refugee status;

- persons with a usual place of residence in Canada who hold a Study Permit;
- · persons with a usual place of residence in Canada who hold a Work Permit;
- persons with a usual place of residence in Canada who hold Minister's permits (including extensions);
- all non-Canadian born dependants of persons claiming refugee status, or of persons holding study permits, work
  permits or minister's permits and living in Canada.

# Net temporary emigrant

Net temporary emigration represents the variation in the number of temporary emigrants between two dates. Temporary emigration includes Canadian citizens and **immigrants** living temporarily abroad who have not maintained a usual place of residence in Canada.

# Population

Estimated population and population according to the census are both defined as being the number of Canadians whose usual place of residence is within that area, regardless of where they happened to be on Census Day. Also included are any Canadians staying in a dwelling in that area on Census Day and having no usual place of residence elsewhere in Canada, as well as those considered **non-permanent residents**.

# **Population estimate**

- (a) Postcensal: Population estimate produced by using data from the most recent available census adjusted for censusnet undercoverage (including adjustment for incompletely enumerated Indian reserves) and estimate of the components of demographic growth since that last census. This estimate can be preliminary, updated or final.
- (b) Intercensal: Population estimate derived by using postcensal estimates and data adjusted for censusnet undercoverage (including adjustment for incompletely enumerated Indian reserves) of censuses preceding and following the year in question.

# Population growth or total growth

Variation of population size between two dates. It can also be obtained by summing the **natural increase**, **total net migration** and if applicable, substract **residual deviation**. It can be positive or negative.

# **Precocity error**

Difference between preliminary and final estimate in terms of its relative proportion of the total population for the relevant geographical area. It can be calculated for either population estimates or components of population growth.

# Rate

Refers to the ratio of the number of events estimated in a year (t,t+1) to the average populations at the beginning and the end of the period. In this regard, births, deaths, immigration rates, etc are calculated. Generally, the rates are expressed in per 1,000.

**Demographic growth rate or population growth rate:** Ratio of population growth between the year t and t+1, to the average **population** of both these years. The rate is generally expressed in per 1,000.

**Overcoverage of population rate:** The ratio of the number of persons who should not have been counted in the census or who were counted more than once to the total number of persons that should have been enumerated in the census. Generally, the rate is expressed in percentage.

**Undercoverage of population rate:**The ratio of the estimated number of persons not enumerated in the census (who were intended to have been enumerated) to the total number of persons that should have been enumerated in the census. Generally, the rate is expressed in percentage.

**Census net undercoverage of population rate:** The difference between the census undercoverage rate and the census ovecoverage rate.

# **Residual deviation**

Difference between demographic **population growth** calculated using **intercensal estimates** of population between two dates and that obtained by the sum of the components for the same period. This deviation results from the distribution (based on the number of days) of the **error of closure** between years within the quinquennial period.

# **Returning emigrant**

Canadian citizen or **immigrant** having previously emigrated from Canada and subsequently returned to the country.

# Sex ratio

The ratio of the number of men to the number of women. This is not to be confused with the sex ratio at birth, which is the ratio of the number of live-born boys to the number of live-born girls. This ratio is usually expressed as an index, with the number of females taken to be a base of 100.

# Sprague coefficients

Series of factors which, when multiplied to a population distributed by multiples age groups, give a distribution of the same population by single years of age.

# Total net migration

Sum of net international and net interprovincial migration.

# Vital events

Includes all the demographic events (births, deaths, marriages and divorces) for which there exists a legal requirement to inform the Provincial or Territorial Registrar's Office.

# Year

Unless otherwise specified, the term "year" refers to the period beginning July 1 of a given year and ending June 30 of the following year.

# Sources and remarks

# **Base population**

May 10, 2011 Census of Population adjusted for census net undercoverage and incompletely enumerated Indian reserves.

2011 Census: Statistics Canada, Census of Canada, 2011, Catalogue no. 98-310-X.

Census net undercoverage: See The Daily, September 26, 2013.

Incompletely enumerated Indian reserves: See The Daily, September 26, 2013.

# **Births and deaths**

Statistics Canada, Health Statistics Division.

Statistics Canada, Demography Division, catalogue no. 91-215-X, annual.

Births: Fertility rates for 2011 based on births by age of mother provided by Health Statistics Division applied to the female population estimates at the beginning of the quarter. Births for Quebec and British Columbia were provided by their respective agencies.

Deaths: Mortality rates for 2011 based on deaths by age group and sex provided by Health Statistics Division applied to the population estimates by age group and sex at the beginning of the quarter. Deaths for Quebec and British Columbia were provided by their respective agencies.

# Immigration

Estimates are based on the immigrant files provided by Citizenship and Immigration Canada (CIC) according to information made available on August 17, 2015.

# Emigration

The estimates are produced by Demography Division using:

- data from Canada Revenue Agency (CRA) Canada Child Tax Benefit files (CCTB) program. From 2013/2014, we used 2012/2013 data;
- tax data calculated using T1FF file provided by the Income Statistics Division of Statistics Canada. From 2012/2013, we used 2011/2012 data;
- data provided by the U.S. Department of Homeland Security, Office of Immigration Statistics. From 2013/2014, we used 2012/2013 data;
- data on the number of adult and children emigrants from T1FF5 file used for the provincial distribution of adults.
   From 2013/2014, we used 2012/2013 data.

# **Returning emigration**

The estimates are produced by Demography Division using:

- data from Canada Revenue Agency (CRA) Canada Child Tax Benefit files (CCTB) program. From 2013/2014, we used 2012/2013 data;
- 2011 National Household Survey question on the place of residence one year ago.

# Net temporary emigration

The estimates are produced by Demography Division using:

- data from the Reverse Record Check (RRC) of the 2011 Census;
- 2011 National Household Survey question on the place of residence 5 years ago;
- estimates of returning emigrants for 2006 to 2011 intercensal period;
- · distribution by age and sex of emigrants

# Non-permanent residents

The estimates are produced by Demography Division using Field Operational Support System files (FOSS) from CIC. These files, received on August 17, 2015, document the number of persons holding permits/authorizations or claiming refugee status.

# Interprovincial migration

The estimates are produced by Demography Division using:

- CCTB-based adjusted migration data for children;
- factors corresponding to the ratio of the migration rate of all children to the migration rate of who are registered to the CCTB program children calculated using 2013/2014 tax file data;
- factors used to calculate adult migration and corresponding to the ratio of the adult to child migration rates, calculated on a three-year basis using tax file data for 2011/2012, 2012/2013 and 2013/2014.
