New Usage of Blaise: Biometrics Inputs

Luc Tremblay ¹

Abstract

Blaise has been in development in Statistics Canada since 1997. Over the years, the complexity of applications that have been deployed using this software is constantly increasing. Last year a very interesting approach has been developed to read bio-metrics directly from medical instruments, and input them into the Blaise software. This presentation will elaborate on this new usage of the software that just opens the door to an infinity of different applications and the added data quality of performing collection in this manner.
