Note of appreciation

Canada owes the success of its statistical system to a long standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

User information

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published

Canadian Industry's Expenditures to Reduce Greenhouse Gas Emissions

by Jeff Fritzsche

1 Introduction

In 2002, the Survey of Environmental Protection Expenditures introduced new material for the purpose of collecting data on industry's initiatives with respect to greenhouse gas emission reductions. This was made possible through five years of funding provided by the Statistical Monitoring of Climate Change Technologies project under the federal government's Action Plan 2000 on Climate Change. The material was developed as part of a multi-departmental Working Group on Climate Change Technologies co-chaired by Industry Canada and Statistics Canada.

2 Overview

Statistics contained in this report are derived from the 2002 and 2004 editions of the Survey of Environmental Protection Expenditures. The tables contain information specifically related to expenditures made by Canadian businesses in 16 industry groups to reduce greenhouse gas emissions. Additional tables include statistics on the technologies used by industry as well as the obstacles and drivers encountered by industry to reduce greenhouse gas emissions.

The 2002 expenditure estimates in this report are revised figures and replace the estimates published in the 2002 survey report "Environmental Protection Expenditures in the Business Sector", catalogue no 16F0006. Improvements made to the methodology used to produce the 2004 estimates were applied to the 2002 estimates to maintain comparability between survey years.

3 Impact of revision on the 2002 expenditure estimates made to reduce greenhouse gas emissions

The impact of the revision of the 2002 estimates resulted in an increase in the estimated overall expenditures made to reduce greenhouse gas emissions. The revised estimate increased by \$170.0 million dollars or 15.8%. The revision had a larger impact on operating expenses than capital expenditure estimates, increasing these 22.6% and 9.8% respectively.

The 2002 estimates for the majority of the 16 industry groups surveyed were revised upwards. The industries with the greatest increase in terms of absolute expenditures included Electric Power Generation, Transmission and Distribution, Wood Products, Chemicals and Fabricated Metal Products industries. The industry with the largest downward revision was Oil and Gas Extraction.

This report includes the 2002 revised expenditure estimates to reduce GHG emissions by industry and by province, as well as the 2004 estimates. Additional tables for reference include both 2002 and 2004 estimates of energy conservation processes and technologies used by industry and the drivers and obstacles faced by industry in the adoption of the energy conservation processes and technologies. Please note that only the tables with expenditure estimates have been revised for 2002.

4 Conclusion

Data collection specifically related to the expenditures to reduce GHG emissions, the impact of those expenditures on emissions and the obstacles and drivers businesses encountered were discontinued after the 2004 reference year due to the sun setting of the Statistical Monitoring of Climate Change Technologies project funding.

Additional analysis of the 2002 and 2004 greenhouse gas-related estimates from the Survey of Environmental Protection Expenditures is available in "Envirostats", catalogue number 16-002-X, Volume 2, No. 2.

Table 1
Proportion of establishments in fossil-fuel related industries that reported greenhouse gas emissions reductions

	2002		2004	
	Reduced fugitive or vented	Reduced other sources	Reduced fugitive or vented	Reduced other sources
	percent ¹			
Oil and gas extraction	90	76	94	75
Natural gas distribution	92	67	92	77
Pipeline transportation	95	67	85	44
Petroleum and coal products	58	89	89	74
Total ²	87	74	90	62

1. Number of establishments that reported the use of systems or equipment to reduce greenhouse gas emissions as a percentage of establishments that reported extracting, refining, transporting, or distributing fossil fuels.
2. Number of establishments that indicated they used at least one energy conservation process or technology as a percentage of the total number of establishments that provided a response.

1. Number of establishments that indicated encountering the obstacle as a percentage of all establishments that provided a response.

Note(s): Establishments who answered "Yes" to adopting new or significantly improved systems or equipment to reduce greenhouse gases during the period 2000-2002 are considered "innovators." Establishments who answered "no" to adopting new or significantly improved systems or equipment to reduce greenhouse gases during the period 2000-2002 are considered "non-innovators". This table includes reported data only. Due to changes in the methodology used to calculate the 2004 results, comparisons to 2002 results are not possible.
