Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Highlights

November estimate of the 2009 production of principal field crops

- The final crop report for 2009 revealed that Prairie farmers harvested a lesser amount of major crops including barley, oats, canola, spring wheat, durum wheat and field peas. In eastern Canada, soybean production rose in Ontario to a near high of 2.6 million tonnes in 2009.

Analysis

November estimate of the 2009 production of principal field crops

The final crop report for 2009 revealed that Prairie farmers harvested a lesser amount of major crops including barley, oats, canola, spring wheat, durum wheat and field peas. In eastern Canada, soybean production rose in Ontario to a near high of 2.6 million tonnes in 2009.

Drought in many western areas during the germination period and excess moisture in eastern regions held back crop development. Throughout the summer, cool conditions held back crop advancement, leading to harvest delays in many areas. However, late-season sunny and dry weather allowed most crops to reach maturity with a substantial improvement in yield for most major grains compared to the mid-harvest survey results reported in September 2009.

Canola production down

In the Prairies, canola production fell 6.5% to 11.7 million tonnes in 2009, the result of a decline in harvested area.

Provincially, Alberta farmers reported a strong decline with production down 26.9% to 3.2 million tonnes, due to reduced yield and harvest area. Modest production gains were reported in Manitoba and Saskatchewan, mostly the result of new highs for yield. Manitoba farmers harvested a record 2.8 million tonnes of canola, an increase of 9.8% from the previous high set in 2008. Saskatchewan producers reported 5.7 million tonnes, an increase of 1.7% from 2008.

Prairie feed grain production stumbles

Production of barley, oats and dry field peas were down across the Prairies mostly the result of declines in harvested area.

Prairie production of barley fell 20.5% to 8.9 million tonnes, and oat production dropped 37.9% to 2.4 million tonnes. Field pea production also fell by 5.4% to 3.4 million tonnes.

More soybeans in Ontario

Soybean production in Ontario rose by 142,900 tonnes to a near high of 2.6 million tonnes, up 5.8% from 2008, the result of an increase in harvested area to 2.4 million acres.

Concepts and definitions

Definitions of the crop categories referenced in Report No. 8, Field Crop Reporting Series are listed below.

Major field crops: wheat, oats, barley, rye, flaxseed, canola, corn for grain and soybeans.

Coarse grains: oats, barley, rye, corn for grain and mixed grains.

Oilseeds: canola, flaxseed and soybeans.

Major special crops: dry field peas, lentils, mustard seed, Canary seed, sunflower seed and chick peas.

Fodder corn and hay

We are now asking respondents to report the percentage moisture of their harvested fodder corn and hay for silage. Estimates of production for fodder corn in this publication are calculated using a standard percentage moisture content of 70%. Production of total hay is reported at a standard dry matter content of 90%.

Methodology and data quality

Survey frame and sample selection

Every five years, the Census of Agriculture collects information on agricultural operations across Canada, including institutional farms, community pastures, Indian reserves, etc. The Census of Agriculture provides a list of farms and their crop areas from which a probability sample for the November crop production estimates is selected.

The target population for the November crop production estimates includes all farms in Canada enumerated in the Census of Agriculture except those on Indian reserves and farms from the Northwest Territories and Yukon. Institutional farms are also excluded from the target population.

Probability surveys can use two types of sampling frames; list and area. In the November Crop Production Survey, only the list frame is used in sample selection. This list frame is stratified into homogenous groups on the basis of Census characteristics (such as farm size and crop area) and sub-provincial geographic boundaries. A sample of approximately 27,900 farms is drawn from the list frame for the November Crop Production Survey.

Data collection

Data collection for the November Crop Production Survey was carried out from October 23 to November 16, 2009.

Data collection for field crop surveys is undertaken using the Computer assisted telephone interview (CATI) system.

Edit and imputation

With the introduction of the CATI system, it is now possible to implement edit procedures at the time of the interview. Computer programmed edit checks in the CATI system inform interviewers during the interview of possible data errors, which can then be corrected immediately by the interviewer and respondent. CATI significantly reduces the need for subsequent telephone follow-up, thereby reducing respondent burden and survey processing time.

Response rate

Usually by the end of the collection period, 85% of the questionnaires have been fully completed. The refusal rate to the survey is approximately 6%. The remainder of the sample unaccounted for, can be explained by non-contact. Initial sample weights are adjusted (a process called raising factor adjustment) in cases of total and partial non-response.

Sampling and non-sampling errors

The statistics contained in this publication are based on a random sample of agricultural operations and, as such, are subject to sampling and non-sampling errors. The overall quality of the estimates depends on the combined effect of these two types of errors.

Sampling errors arise because estimates are derived from sample data and not the entire population. These errors depend on factors such as sample size, sampling design and the method of estimation. An important feature of probability sampling is that sampling errors can be measured from the sample itself.

Non-sampling errors are errors which are not related to sampling and may occur throughout the survey operation for many reasons. For example, non-response is an important source of non-sampling error. Coverage, differences in the interpretation of questions, incorrect information from respondents, mistakes in recording, coding and processing of data are other examples of non-sampling errors.

Estimation

The survey data collected are weighted in order to produce unbiased level indicators which are representative of the population. These level indicators then undergo a validation process, based on subject matter analysis and consultation with provincial statisticians, before a final estimate is published.

Revised production estimate

The November crop production estimates contained in this publication are final for the crop year. Revisions to the crop estimates may still be made for up to two years after the end of the crop year.

The following table contains some statistics which indicate the magnitude and direction of the updates between the November Crop Production Survey and final crop estimates. The magnitude is measured by the average percent change between the preliminary and final estimates. The direction of the update is indicated by counting the number of years that the preliminary estimate is above or below the final published estimate.

The data indicate, for example, that the estimates of the November production for barley are changed by a magnitude of, on average, 2.6% and usually in a downwards direction.

Text table 1

Magnitude and direction of changes between November and final production estimates, Canada 1999 to 2009

Crop	Number of years preliminary farms production data are amended:		
	Average change	Upwards	Downwards
	percent	number	
Wheat	3.1	3	7
Oats	3.5	2	6
Barley	2.6	2	7
Flaxseed	2.4	1	4
Canola	4.4	5	4
Corn for grain	1.0	4	4
Dry peas	4.3	1	6
Soybeans	0.8	4	4

Data quality

The November crop production estimates are based on level indicators obtained from a probability survey of farming operations. The potential error introduced by sampling can be estimated from the sample itself by using a statistical measure called the coefficient of variation (c.v.). Over repeated surveys, 95 times out of 100, the relative difference between a sample estimate and what should have been obtained from an enumeration of all farming operations would be less than twice the coefficient of variation. This range of values is referred to as the confidence interval. While published estimates may not exactly equal the level indicators (due to the validation and consultation process), these estimates do remain within the confidence interval of the survey level indicators. For the November Crop Production Survey, c.v.'s at the Canada level range from 1% to 5% for the major crops.

For the different types of special crops, the estimates contained in this publication have been assigned a letter to indicate their c.v. (expressed as a percentage). The letter grades represent the following c.v. ranges:

Text table 2
Coefficient variation rating system for special crops

Coefficient variation range	Symbol	Meaning
0.00% to 4.99%	A	Excellent
5.00% to 9.99%	B	Very good
10.00% to 14.99%	C	Good
15.00% to 24.99%	D	Use with caution
25.00% and more	F	Too unreliable to publish

Data confidentiality

Data confidentiality is ensured under the *Statistics Act*, which prohibits the divulging of individual or aggregated data where individuals or businesses might be identified.

Field crop reporting series calendar

Catalogue 22-002-X

The eight reports in this series, which are released at strategic times during the crop year, contain data on stocks of grain and crop area, yield and production. Three reports provide data on stocks of grain at both farm and commercial positions for Canada and the provinces (report nos. 1, 3 and 6). The first report on seeded area (no. 2, in April) contains the seeding intentions of producers, while the June report (no. 4) contains the actual seeded areas of field crops. Yields and levels of production by province are estimated before harvest (report no. 5), during harvest (no. 7) and after harvest (no. 8). Release time for all reports is 08:30 hrs, Eastern time. For further information, please contact Client Services, Agriculture Division, Statistics Canada at 1-800-465-1991 or by email: agriculture@statcan.gc.ca

Cereals and oilseeds review

Catalogue 22-007-X

This publication provides up-to-date marketing data and analysis for wheat, coarse grains, oilseeds and special crops. Each monthly issue contains producer marketings, exports of grain and grain products, domestic and international supply-disposition tables, oilseed crushing and grain milling data, and cash and future prices. A situation report highlights the month's events.

Some issues contain annual supplementary data. They include the Prices supplement; the Processing supplement; the Methodology and concepts supplement; the Feed grain purchases supplement and the Grain storage & movement supplement.
