## November estimates of production of principal field crops

- Production of all varieties of wheat at the national level increased from 2010, while canola production hit a record high, according to the third and final production estimates for 2011. In contrast, farmers reported a decline in both corn and soybean crops.

# Analysis

---

## November estimates of production of principal field crops

Production of all varieties of wheat at the national level increased from 2010, while canola production hit a record high, according to the third and final production estimates for 2011. In contrast, farmers reported a decline in both corn and soybean crops.

In the West, farmers reported that hot, sunny weather during the summer helped them recover from a damp and late spring in certain areas. Similarly, weather patterns in the East returned to normal after a particularly wet spring, especially in Québec's Richelieu river area.

### Prairie canola production hits record high

Prairie farmers reported that canola production increased 10.7% from 2010 to a record 14.0 million tonnes. This was the result of a 9.1% increase in harvested acres to a record 18.3 million acres, and a 1.5% increase in average yield.

Canola production reached record levels in both Alberta (5.3 million tonnes) and Saskatchewan (7.0 million tonnes), driven by record levels of harvested acres in both provinces and a record yield in Alberta.

On the other hand, canola production declined 25.3% in Manitoba where farmers were unable to recover from early season flooding. This was the province's second consecutive annual decline in canola production.

### Total wheat production increases

Nationally, total wheat production reached 25.3 million tonnes, up 9.0% or 2.1 million tonnes from 2010. Reported yield was 44.0 bushels per acre, up 5.5% from 2010.

Farmers reported record yields for wheat in both Alberta (49.1 bushels per acre) and Saskatchewan (38.6 bushels per acre). This drove total production up 9.0% to 8.9 million tonnes in Alberta and 20.5% to 11.5 million tonnes in Saskatchewan.

A significant contributor to the overall production increase was durum wheat. Durum wheat production increased 36.4% in Saskatchewan to 3.6 million tonnes, and 47.1% in Alberta, to 620,500 tonnes. These increases followed substantial declines from 2009 to 2010.

### Decline in soybeans and corn

Soybean production in Ontario, Québec and Manitoba declined from the record levels reached in 2010, primarily the result of lower yields. This occurred despite record harvested areas in both Manitoba and Québec.

Ontario soybean production amounted to 3.0 million tonnes, a decline of 2.7% or 81,600 tonnes from the all-time high set in 2010. The decrease was the result of a 2.4% decline in yield to 44.9 bushels per acre.

In Québec, soybean production declined 0.9% to 800,000 tonnes despite a record harvested area of 738,800 acres. The drop was the result of a 13.5% decline in average yield to 39.8 bushels per acre, compared with the record high of 46.0 bushels in 2010.

In Manitoba, farmers reported a record harvested area of soybeans for 2011. However, lower yields had an impact on production, which fell 5.0% to 413,700 tonnes.

With respect to corn for grain, Ontario production reached 7.2 million tonnes, down 6.6% or 508,100 tonnes from 2010. Québec production amounted to 2.9 million tonnes, down 14.1% or 480,000 tonnes from 2010.

1. Grain exports and imports include seed.

# Concepts and definitions

---

## Crop categories

**Major field crops:** wheat, oats, barley, rye, flaxseed, canola, corn for grain and soybeans.

**Oilseeds:** canola, flaxseed, soybeans and sunflower seed.

**Major special crops:** dry white beans, coloured dry beans, dry peas, lentils, mustard seed, sunflower seed, Canary seed and chick peas.

## Fodder corn and hay

We are asking respondents to report the percentage moisture of their harvested fodder corn and hay for silage. Estimates of production for fodder corn in this publication are calculated using a standard percentage moisture content of 70%. Production of total hay is reported at a standard dry matter content of 90%.

# Methodology and data quality

---

## Survey frame and sample selection

Every five years, the Census of Agriculture collects information on agricultural operations across Canada, including institutional farms, community pastures, farms on First Nations reserves, etc. The Census of Agriculture provides a list of farms and their crop areas from which a probability sample for the November Farm Survey is selected.

The target population for the November Farm Survey includes all farms in Canada enumerated in the Census of Agriculture, except institutional farms on First Nations reserves and farms from the Northwest Territories, Yukon and Nunavut.

Probability surveys can use two types of sampling frames; list and area. In the November Farm Survey, only the list frame is used in sample selection. This list frame is stratified into homogenous groups on the basis of Census characteristics (such as farm size and crop area) and sub-provincial geographic boundaries. A sample of approximately 28,600 farms has been drawn from the list frame for the November 2011 Farm Survey.

## Data collection

The November 2011 Farm Survey was carried out from October 24 to November 10. Data collection is undertaken using the “Computer assisted telephone interview” (CATI) system.

## Edit and imputation

With the CATI system, it is possible to implement edit procedures at the time of the interview. Computer programmed edit checks in the CATI system inform interviewers during the interview of possible data errors, which can then be corrected immediately by the interviewer and respondent. CATI significantly reduces the need for subsequent telephone follow-up, thereby reducing respondent burden and survey processing time.

## Response rate

Usually by the end of the collection period, 80% of the questionnaires have been fully completed. The refusal rate to the survey is approximately 8 to 9%. The remainder of the sample unaccounted for can be explained by non-contact or non-response. Initial sample weights are adjusted by a process called “raising factor adjustment” in cases of total and partial non-response.

## Sampling and non-sampling errors

The statistics contained in this publication are based on a random sample of agricultural operations and, as such, are subject to sampling and non-sampling errors. The overall quality of the estimates depends on the combined effect of these two types of errors.

Sampling errors arise because estimates are derived from sample data and not from the entire population. These errors depend on factors such as sample size, sampling design and the method of estimation. An important feature of probability sampling is that sampling errors can be measured from the sample itself.

Non-sampling errors are errors which are not related to sampling and may occur throughout the survey operation for many reasons. For example, non-response is an important source of non-sampling error. Coverage, differences in

the interpretation of questions, incorrect information from respondents, mistakes in recording, coding and processing of data are other examples of non-sampling errors.

## Estimation

The survey data collected are weighted in order to produce unbiased level indicators which are representative of the population. These level indicators then undergo a validation process, based on subject matter analysis, before final estimates are published.

## Revisions

The November crop production estimates contained in this publication are final for the current crop year. Revisions to these estimates may still be made for up to two years after the end of the crop year.

The following table contains some statistics which indicate the magnitude and direction of the updates between the November production and final revised production estimates. The magnitude is measured by the average percent change between the final and revised estimates. The direction of the update is indicated by counting the number of years that the preliminary estimate is above or below the final revised estimate. The data indicate, for example, that the estimates of the November production for barley are revised by a magnitude of 2.9% on average, and usually in a downwards direction.

**Text table 1**  
**Magnitude and direction of changes between November and revised production estimates, Canada, 2001 to 2010**

Crop	Average percent change	Number of years November production estimates are revised:	
		Upwards	Downwards
	%	number	
Wheat	3.5	2	6
Oats	4.0	4	4
Barley	2.9	2	5
Flaxseed	2.5	1	3
Canola	6.8	5	4
Corn for grain	0.9	2	4
Dry peas	5.2	2	6
Soybeans	0.8	3	4

## Data quality

The November crop production estimates are based on level indicators obtained from a probability survey of farming operations. The potential error introduced by sampling can be estimated from the sample itself by using a statistical measure called the “coefficient of variation” (c.v.). Over repeated surveys, 95 times out of 100, the relative difference between a sample estimate and what would have been obtained from an enumeration of all farming operations is less than twice the c.v.. This range of values is referred to as the “confidence interval”. While published estimates may not exactly equal the level indicators due to the validation, these estimates do remain within the confidence interval of the survey level indicators. For the November Farm Survey, c.v.’s range from 1% to 5% for the major crops. C.v.’s for specialty crops and small areas are usually between 6% and 25%.

For the different types of special crops, the estimates contained in this publication have been assigned a letter to indicate their coefficient of variation (c.v.) expressed as a percentage. The letter grades represent the following c.v. ranges:

**Text table 2**  
**Coefficient of variation rating system for special crops**

Coefficient variation range	Grade	Meaning
0.00% to 4.99%	A	Excellent
5.00% to 9.99%	B	Very good
10.00% to 14.99%	C	Good
15.00% to 24.99%	D	Use with caution
25.00% and more	F	Too unreliable to publish

### Data confidentiality

Data confidentiality is ensured under the *Statistics Act*, which prohibits the divulging of individual or aggregated data where individuals or businesses might be identified.

# Field crop reporting series calendar

---

## Catalogue 22-002-X

The eight reports in this series, which are released at strategic times during the crop year, contain data on stocks of grain and crop area, yield and production. Three reports provide data on stocks of grain at both farm and commercial positions for Canada and the provinces (report nos. 1, 3 and 6). The first report on seeded area (no. 2, in April) contains the seeding intentions of producers, while the June report (no. 4) contains the actual seeded areas of field crops. Yields and levels of production by province are estimated before harvest (report no. 5), during harvest (no. 7) and after harvest (no. 8). Release time for all reports is 08:30 hrs, Eastern time. For further information, please contact Client Services, Agriculture Division, Statistics Canada at 1-800-465-1991 or by email: [agriculture@statcan.gc.ca](mailto:agriculture@statcan.gc.ca)

Report No. and Title	2012 Release Dates
1 Stocks of principal field crops at December 31, 2011	February 3
2 March intentions of principal field crop areas	April 24
3 Stocks of principal field crops at March 31, 2012	May 7
4 Preliminary estimates of principal field crop areas	June 27
5 July estimates of production of principal field crops	August 22
6 Stocks of principal field crops at July 31, 2012	September 7
7 September estimates of production of principal field crops	October 4
8 November estimates of production of principal field crops	December 5

## Cereals and oilseeds review

### Catalogue 22-007-X

This publication provides up-to-date marketing data and analysis for wheat, coarse grains, oilseeds and special crops. Each monthly issue contains producer marketings, exports of grain and grain products, domestic and international supply-disposition tables, oilseed crushing and grain milling data, and cash and future prices. A situation report highlights the month's events.

Some issues contain annual supplementary data. They include the Prices supplement; the Processing supplement; the Methodology and concepts supplement; the Feed grain purchases supplement and the Grain storage & movement supplement.

For further information, please contact Client Services, Agriculture Division, Statistics Canada at 1-800-465-1991 or by email: [agriculture@statcan.gc.ca](mailto:agriculture@statcan.gc.ca)
