How to obtain more information

For information about this product or the wide range of services and data available from Statistics Canada, visit our website, www.statcan.gc.ca.

You can also contact us by

email at STATCAN.infostats-infostats.STATCAN@canada.ca

telephone, from Monday to Friday, 8:30 a.m. to 4:30 p.m., at the following numbers:

- Statistical Information Service 1-800-263-1136
- National telecommunications device for the hearing impaired 1-800-363-7629
- Fax line 1-514-283-9350

Depository Services Program

- Inquiries line 1-800-635-7943
- Fax line 1-800-565-7757

Standards of service to the public

Statistics Canada is committed to serving its clients in a prompt, reliable and courteous manner. To this end, Statistics Canada has developed standards of service that its employees observe. To obtain a copy of these service standards, please contact Statistics Canada toll-free at 1-800-263-1136. The service standards are also published on www.statcan.gc.ca under “Contact us” > “Standards of service to the public.”

Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued co-operation and goodwill.

Standard table symbols

The following symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- ^P preliminary
- ^r revised
- X suppressed to meet the confidentiality requirements of the *Statistics Act*
- ^E use with caution
- F too unreliable to be published
- * significantly different from reference category ($p < 0.05$)

Note on CANSIM

Data that appears in the **The Consumer Price Index** (catalogue no. 62-001-X) are also available electronically, free of charge under the Statistics Canada Open Licence Agreement, in our CANSIM (Canadian Socio-Economic Information Management System) database through the Internet, under tables 326-0009, 326-0012, 326-0015, 326-0020, 326-0021, 326-0022, 326-0023, 326-8023 and 326-0031. In general, CANSIM provides a longer historical series. For further information on CANSIM call 1-800-263-1136.

Note to users

The Consumer Price Index is published monthly and is not subject to revisions.

Publication of additional sub-indexes

On April 20 2018, with the release of the March 2018 Consumer Price Index (CPI), Statistics Canada published additional CPI sub-indexes providing an increased level of detail at lower levels of aggregation, which are available in CANSIM tables 326-0020 and 326-0021.

Methodological change: Air Transportation Index

The release of the March 2018 CPI marks the introduction of new travel destinations and a change in the data sources used to compile the air transportation index.

The air transportation index represents 1.24% of the 2015 CPI basket at link month (December 2016) prices and is part of Transportation, one of the major CPI components.

Beginning with the March 2018 CPI release, the coverage of the air transportation index has increased from 18 to 53 city-pairs. A city-pair combines a Canadian city within the province of residence of a consumer, with the final destination of the consumer.

Collecting Airfare Prices

The new approach replaces administrative data with airfare prices collected on the Internet. Prices are now collected for round trips, with considerations given to advanced booking and trip length.

These changes are expected to better reflect seasonal patterns in the cost of air transportation experienced by Canadians. Users should note that changing methodological elements of any index may result in variations in the series. As such, interpretation of the 12-month price change indicator should be made with caution, particularly in the year following the implementation of a new methodology.

Real-time CANSIM tables

Real-time CANSIM table 326-8023 will be updated on May 7. For more information, consult the document *Real-time CANSIM tables* (www.statcan.gc.ca/eng/dai/btd/rct).

The Consumer Price Index — March 2018

Highlights

Main contributors to the 12-month change in the CPI:

Main upward contributors:

- Gasoline (+17.1%)
- Food purchased from restaurants (+4.4%)
- Air transportation (+16.0%)
- Homeowners' replacement cost (+3.0%)
- Purchase of passenger vehicles (+1.7%)

Main downward contributors:

- Electricity (-4.3%)
- Digital computing equipment and devices (-5.4%)
- Telephone services (-1.3%)
- Video equipment (-9.1%)
- Furniture (-1.4%)

Main contributors to the monthly change in the CPI, not seasonally adjusted:

Main upward contributors:

- Travel tours (+13.0%)
- Gasoline (+2.9%)
- Air transportation (+2.9%)
- Women's clothing (+2.2%)
- Men's clothing (+2.4%)

Main downward contributors:

- Purchase of passenger vehicles (-1.5%)
- Telephone services (-2.5%)
- Fresh vegetables (-2.1%)
- Fresh fruit (-2.6%)
- Natural Gas (-2.3%)

Analysis

Please note that the analytical text and charts previously found in this section continue to be available in *The Daily* (www.statcan.gc.ca/daily-quotidien/180420/dq180420a-eng.htm).

1. A seasonally adjusted series is one from which seasonal movements have been eliminated. Each month, the previous month's seasonally adjusted index is subject to revision. On an annual basis, the seasonally adjusted values for the last three years are revised with the January data release. Users employing Consumer Price Index data for indexation purposes are advised to use the unadjusted indexes. For more information on the availability and uses of seasonally adjusted CPI data, please see the Definitions, data sources and methods section of survey 2301.

2. The special aggregate "energy" comprises electricity, natural gas, fuel oil and other fuels, gasoline, and fuel, parts and accessories for recreational vehicles.

Table 3
The Consumer Price Index, provinces, Whitehorse, Yellowknife and Iqaluit,¹ not seasonally adjusted

	CANSIM vector number	Indexes			Percentage change	
		March 2017	February 2018	March 2018	February 2018 to March 2018	March 2017 to March 2018
		2002=100			%

1. The annual average index is calculated as the average of the published 12 individual monthly indexes, rounded to one decimal place. Percentage changes between the annual average indexes are calculated based on these published rounded numbers. Between May 2007 and September 2007, the annual average percentage changes in Table 5 were calculated based on annual average indexes that were not rounded. As a result, some percentage changes were different by +/- 0.1 from the official percentage change. This problem only affected the annual average column of Table 5.

1. For more information on these measures of core inflation, please consult the methodology and general information documents found in our Definitions, data sources and methods – record number 2301.

2. The Bank of Canada's preferred measures of core inflation, CPI-common, CPI-median and CPI-trim, are subject to revision. In the case of CPI-median and CPI-trim, the revisions result from the fact that these measures are based on seasonally adjusted price index series. In the case of CPI-common, revisions are due to the statistical technique used, as the factor model is estimated over all available historical data. The CANSIM table 326-8023 contains historical data for these three measures and is updated on a monthly basis.

3. This measure is based on Consumer Price Index (CPI) series adjusted to remove the effect of changes in indirect taxes.

4. This measure is based on Consumer Price Index (CPI) series that have been treated to remove the effect of changes in indirect taxes, and that have been seasonally adjusted.

5. CPI-common is a measure of core inflation that tracks common price changes across categories in the Consumer Price Index (CPI) basket.

6. CPI-median is a measure of core inflation corresponding to the price change located at the 50th percentile (in terms of the Consumer Price Index (CPI) basket weights) of the distribution of price changes in a given month.

7. CPI-trim is a measure of core inflation that excludes Consumer Price Index (CPI) components whose rates of change in a given month are located in the tails of the distribution of price changes.

1. Goods are physical or tangible commodities usually classified according to their life span into non-durable goods, semi-durable goods and durable goods. Non-durable goods are those goods that can be used up entirely in less than a year, assuming normal usage. For example, fresh food products, disposable cameras and gasoline are non-durable goods. Semi-durable goods are those goods that may last less than 12 months or greater than 12 months depending on the purpose to which they are put. For example, clothing, footwear and household textiles are semi-durable goods. Durable goods are those goods which may be used repeatedly or continuously over more than a year, assuming normal usage. For example, cars, audio and video equipment and furniture are durable goods.

2. A service in the Consumer Price Index (CPI) is characterized by valuable work performed by an individual or organization on behalf of a consumer, for example, car tune-ups, haircuts and city public transportation. Transactions classified as a service may include the cost of goods by their nature. Examples include food in restaurant food services and materials in clothing repair services.

3. The special aggregate "energy" includes: "electricity", "natural gas", "fuel oil and other fuels", "gasoline", and "fuel, parts and accessories for recreational vehicles".

4. The annual index level is the average of the 12 individual monthly indexes.

Note: For information on the continuity of the series, see "Data quality, concepts and methodology — Weights and Linking".

1. The annual index level is the average of the 12 individual monthly indexes. The percentage change for a given calendar year is calculated using the annual average indexes.

2. Data for Iqaluit are on a December 2002=100 base (200212=100) and the Standard Geographical Classification (SGC) 2001. Previous to April 1, 1999, the town of Iqaluit formed part of the Northwest Territories. On April 1, 1999, the town of Iqaluit formed part of the newly-created territory of Nunavut.

1. The special aggregate "energy" includes: "electricity", "natural gas", "fuel oil and other fuels", "gasoline", and "fuel, parts and accessories for recreational vehicles".

2. Part of the increase first recorded in the shelter index for Yellowknife for December 2004 inadvertently reflected rent increases that actually occurred earlier. As a result, the change in the shelter index was overstated in December 2004, and was understated in the previous two years. The shelter index series for Yellowknife has been corrected from December 2002. In addition, the Yellowknife All-items Consumer Price Index (CPI) and some Yellowknife special aggregate index series have also changed. Data for Canada and all other provinces and territories were not affected.

1. Data for Iqaluit are on a December 2002=100 base (200212=100) and the Standard Geographical Classification (SGC) 2001. Previous to April 1, 1999, the town of Iqaluit formed part of the Northwest Territories. On April 1, 1999, the town of Iqaluit formed part of the newly-created territory of Nunavut.

2. The annual index level is the average of the 12 individual monthly indexes.

1. With the introduction of the 1992 basket in January 1995, emphasis was shifted from city data to provincial data. City all-items series were continued since many users had come to rely on this service, but the method of calculation was changed. Shelter indexes are calculated for each city. This recognizes the importance of shelter in the basket, the significant and persistent differences in price movements between cities, and the availability of local data. For the other seven major components, the movement of the provincial counterpart is used except in the cases of Montréal, Toronto, and Vancouver, where a sub-provincial counterpart is used. The major components are aggregated using the city's expenditure pattern to arrive at each city's all-items index.

2. Formerly Ottawa (Ottawa-Gatineau, Ontario part), represents Ottawa only.

1. With the introduction of the 1992 basket in January 1995, emphasis was shifted from city data to provincial data. City all-items series were continued since many users had come to rely on this service, but the method of calculation was changed. Shelter indexes are calculated for each city. This recognizes the importance of shelter in the basket, the significant and persistent differences in price movements between cities, and the availability of local data. For the other seven major components, the movement of the provincial counterpart is used except in the cases of Montréal, Toronto, and Vancouver, where a sub-provincial counterpart is used. The major components are aggregated using the city's expenditure pattern to arrive at each city's all-items index.

2. The annual index level is the average of the 12 individual monthly indexes.

3. Formerly Ottawa (Ottawa-Gatineau, Ontario part), represents Ottawa only.

Note: The all-items index for Whitehorse, Yellowknife and Iqaluit is available from table 10.

Regular, unleaded gasoline at self-service stations, cents per litre	(v41838376)	120.6	119.7	123.1

1. Prices are expressed in dollars, except for the price of gasoline which is expressed in cents per litre.

Average retail prices for food, household supplies, personal care items, cigarettes and gasoline

Table 14 shows, for the current month and the two previous months, average prices for selected food, household supplies, personal care items, cigarettes and for gasoline.

Prices for these items are collected as part of the regular monthly Consumer Price Index (CPI) survey. Prices for the selected food, household supply and personal care items are observed in food supermarkets and drug stores, while prices for cigarettes are collected in supermarkets, department stores, drug stores and tobacco shops. Prices for regular unleaded self-serve gasoline are collected by administrative data. In each geographic area defined for pricing purposes, the average prices of each product are weighted by the population of the area in question to calculate the average Canadian retail price of each product. For regular unleaded self-serve gasoline, average city prices are weighted by provincial volume supplied and cities' population to calculate the Canada average retail price.

Products that are priced can vary in quality between outlets or between geographic areas. Brands and outlets can also vary from month to month. Therefore, average prices may not necessarily be fully comparable from one month to another and should not be used as an appropriate measure of pure price change through time. A matched product and outlet sample is used for the CPI to determine the pure price movement of products through time.

1. As of reference year 2016, the inter-city price indexes have been estimated for 12 cities. A new geographic stratum, Calgary, Alberta, has been introduced in this table. As a result, caution should be exercised when comparing these data with previous years' estimates.

2. The weights shown are rounded 2015 basket weights at December 2016 prices for Canada. They are provided for illustration only; the weights actually used are combined city weights with adjustments for price changes up until October 2016.

3. Includes the following subgroups: sugar and syrup, confectionery items, margarine, other edible fat and oil items, coffee, tea, condiments, spices and vinegar, soup, baby foods, pre-cooked frozen food preparations, non-alcoholic beverages and all other food preparations.

Note: See Table B for complete list of vector numbers.

Purpose and Scope

Table 15 shows estimates of price differences between 12 Canadian cities in all 10 provinces, as of October 2016. These estimates are based on a selection of products (goods and services) purchased by consumers in each of the 12 cities.

These estimates should not be interpreted as a measure of differences in the cost of living between cities. The indexes provide price comparisons for a selection of products only, and are not meant to give an exhaustive comparison of all goods and services purchased by consumers. Additionally, the shelter price concept used for these indexes is not conducive to making cost-of-living type comparisons between cities (see below).

Methodology

In order to produce optimal inter-city indexes, product comparisons were initially made by pairing cities that are in close geographic proximity. The resulting price level comparisons were then extended to include comparisons between all of the cities, using a chaining procedure. The following initial pairings were used:

St. John's, Newfoundland and Labrador	Halifax, Nova Scotia
Charlottetown-Summerside, Prince Edward Island	Halifax, Nova Scotia
Saint John, New Brunswick	Halifax, Nova Scotia
Halifax, Nova Scotia	Ottawa, Ontario
Montréal, Quebec	Toronto, Ontario
Ottawa, Ontario	Toronto, Ontario
Toronto, Ontario	Winnipeg, Manitoba
Regina, Saskatchewan	Winnipeg, Manitoba
Edmonton, Alberta	Winnipeg, Manitoba
Vancouver, British Columbia	Edmonton, Alberta
Calgary, Alberta	Edmonton, Alberta

Reliable inter-city price comparisons require that the selected products be very similar across cities. This ensures that the variation in index levels between cities is due to pure price differences and not to differences in the attributes of the products, such as size and/or quality.

Within each city pair, product price quotes were matched on the basis of detailed descriptions. Whenever possible, products were matched by brand, quantity and with some regard for the comparability of retail outlets from which they were selected.

Additionally, the target prices for this study are final prices and as such, include all sales taxes and levies applied to consumer products within a city. This can be an important source of variation when explaining differences in inter-city price levels.

It should be noted that price data for the inter-city indexes are drawn from the sample of monthly price data collected for the Consumer Price Index (CPI). Given that the CPI sample is optimized to produce accurate price comparisons through time, and not across regions, the number of matched price quotes between cities can be small. It should also be noted that, especially in periods when prices are highly volatile, the timing of the product price comparison can significantly affect city-to-city price relationships.

The weights used to aggregate the different product indexes within a city are based on the combined consumption expenditures of households living in the 12 cities tracked. As such, one set of weights is used for all 12 cities. Currently, 2015 expenditures are used to derive the weights. These expenditures are expressed in October 2016 prices.

The inter-city index for a particular city is compared to the weighted average of all 12 cities, which is equal to 100. For example, an index value of 102 for a particular city means that prices for the measured commodities are 2% higher than the weighted, combined city average.

Additional Information on Shelter

Shelter prices were absent from the inter-city index program prior to 1999 because of methodological and conceptual issues associated with their measurement. The diverse nature of shelter means that accurate matches between cities are often difficult to make.

To account for some of these difficulties, a rental equivalence approach is used to construct the inter-city price indexes for owned accommodation. Such an approach uses market rents as an approximation to the cost of the shelter services consumed by homeowners. It is important to note that this approach may not be suitable for the needs of all users. For instance, since the rental equivalence approach does not represent an out-of-pocket expenditure, the indexes should not be used for measuring differences in the purchasing power of homeowners across cities.

Data quality, concepts and methodology

Definition

The Consumer Price Index (CPI) is an indicator of the changes in consumer prices experienced by the target population. The CPI measures price change by comparing, through time, the cost of a fixed basket of goods and services. The CPI basket is based on the expenditures of the target population in a certain reference period. A list of baskets and reference months is available in **The Canadian Consumer Price Index Reference Paper**, catalogue no. 62-553-X. Since a basket contains goods and services of unchanging or equivalent quantity and quality, the index reflects only pure price movements.

Separate CPIs are published for Canada, the ten provinces, Whitehorse, Yellowknife and Iqaluit. Some CPI information is also available for an additional sixteen urban centres. Since the CPI is a measure of price change from one time period to another, it cannot be used to indicate differences in price levels between provinces or urban centres.

Population coverage

The population targeted by the CPI consists of families and individuals living in urban and rural private households. For practical reasons, residents of the Territories outside Whitehorse, Yellowknife and Iqaluit are not represented by the index. Prior to January 1995, the target population consisted of private households in Canadian urban centres with a population of 30,000 or more.

Time base

The CPI compares, in percentage terms, prices in any given time period to prices in the official base period which, at present, is 2002=100. The official time base was changed from 1992=100 to 2002=100 starting with the CPI for May 2007. The change is strictly an arithmetic conversion which alters the index levels but leaves the percentage changes between any two periods intact, except for differences in rounding.

Percent versus index point changes

The movements of the indexes from one month to another are expressed as percent changes rather than changes in index points. Index point changes are affected by the level of the index which, in turn, depends on the time base of the particular index. The percentage change between any two time periods can be readily calculated by dividing the index point difference between the two time periods by the index for the earlier period and multiplying the result by one hundred.

Price coverage

The prices used in the CPI calculation are final prices, inclusive of excise and other indirect taxes paid by consumers. In particular, they include the Goods and Services Tax (GST), as well as provincial retail sales taxes wherever applicable. In regions where the GST and provincial retail sales taxes have been combined, the Harmonized Sales Tax (HST) is included. It follows that the CPI can change as a result of modifications to any of these taxes.

The selection of products and the outlets from which prices are collected is judgmental, other than for rents and traveler accommodation. The number of prices required for a given good or service depends on the importance and the nature of the product. The samples are designed to represent volume selling goods and services and outlets. The principal objective of the sample design is to ensure an informative, reliable and impartial picture of consumer inflation at the national and provincial levels.

The prices of most of the goods and services surveyed for the CPI are usually collected in the first two weeks of the reference month. Food prices are collected in the first three weeks, while gasoline prices are collected in four weeks of each month. Although prices for most CPI goods and services are collected monthly, prices for products having less frequent price changes (e.g. property taxes and electricity rates) are collected at intervals longer than

one month. Special pricings are carried out where there is evidence that significant price changes have occurred between scheduled pricing periods.

Weights and linking

The CPI maintains fixed quantitative proportions (weights) between goods and services during the life of a given basket. The baskets are updated periodically to take into account changes in consumer expenditure patterns. In February 2017, with the release of the January 2017 CPI, the basket reflecting the 2015 expenditure patterns replaced the 2013 basket. The continuity of the CPI series is maintained by “linking” the corresponding indexes obtained from consecutive baskets.

The CPI is calculated as a weighted average of specified goods and services price indexes. The weights are derived from Survey of Household Spending data.

When reconstructing or re-aggregating published CPI series, the changes in weights and the linking procedures must be taken into account. For a description of the methodology required to reconstruct or re-aggregate CPI series, see **The Canadian Consumer Price Index Reference Paper**, catalogue no. 62-553-X (Occasional), or contact Consumer Prices Division.

Whitehorse, Yellowknife and Iqaluit indexes

The relatively small size of the housing market in these three cities makes it difficult to construct reliable price indexes for new houses. To compensate, the price movements of rental accommodation are used to approximate the price movements of new houses. The rent information itself is collected using different pricing frequencies and collection methods than in the rest of the country. Because of these problems, the indexes for Rented Accommodation and Owned Accommodation are not published for these three cities. Further, the all-items indexes published for these three cities are not strictly comparable with the same indexes for the provinces or the other sixteen cities.

Calculation of city indexes

With the introduction of the 1992 basket, emphasis was shifted from city data to provincial data. City all-items series were continued since many users had come to rely on this service, but the method of calculation was changed. Shelter indexes are calculated for each city. This recognizes the importance of Shelter in the basket, the significant and persistent differences in price movements between cities, and the availability of local data. For the other seven major components, the movement of the provincial counterpart (or, in the cases of Montréal, Toronto, and Vancouver, a sub-provincial counterpart) is used. The major components are aggregated using the city’s expenditure pattern to arrive at each city’s all-items index.

Seasonal adjustment

A seasonally adjusted series is one from which seasonal movements have been eliminated. Seasonal movements are defined as those which are caused by regular annual events such as variations in climate and regular institutional events such as vacations and statutory holidays. Seasonally adjusted series are calculated using Statistics Canada’s X-12 ARIMA program. Time series with no detectable seasonal movements remain unchanged from the official series. The official unadjusted series for the all-items index, each of the eight major component indexes and two special aggregates (all-items excluding food and all-items excluding food and energy) are seasonally adjusted independently.

Each month, the previous month’s seasonally adjusted index is subject to revision. On an annual basis, the seasonally adjusted values for the last three years are revised with the January data release. Since these revisions can lead to changes in both the levels and movements of the indexes, users employing the CPI for indexation purposes are advised to use the unadjusted indexes.
