

PERSPECTIVES

ON LABOUR AND INCOME

Fact-sheet on work absences

Table 1: Demographic differences

In 2002, excluding women on maternity leave, an estimated 7.6% (771,200) of full-time employees missed some work each week for personal reasons: 5.5% for own illness or disability, and 2.1% for personal or family responsibilities. As a result of these absences, full-time employees lost about 3.6% of their work time each week.

On average, each full-time employee lost 9.0 days over the year for personal reasons (about 7.3 for own illness or disability, and 1.7 for personal or family demands). In total, full-time employees missed an estimated 92 million workdays for personal reasons in 2002.

On average, men working full time lost fewer days (7.9 or 6.4 for illness plus 1.6 for personal/family demands) than female full-time employees (10.4 or 8.6 plus 1.9).

The presence of preschool-aged children tends to exert a strong influence on work absences for personal or family responsibilities, especially for women. In such families, women employed full time lost an average of 5.1 days in 2002; men, 3.9 days.

Workdays missed due to illness or disability tended to rise with age, from an average of 5.0 days for youth (15 to 19 years) to 10.7 for full-time employees aged 55 to 64.

Table 2: Industry and sector

Work absence rates differ by sector (public or private) and industry. Contributing factors include the nature and demands of the job, the male/female composition of the workforce, and the union density—the last being a strong determinant of the presence or lack of paid sick/family leave entitlements.

Full-time employees in the public sector lost more work time in 2002 (about 11.7 days on average) for personal reasons than their private-sector counterparts (8.2 days).

At the major industry level, the most workdays missed were by employees in health care and social assistance (13.4 days), and in public administration (11.0).

The lowest averages were recorded by full-time workers in the professional, scientific and technical industry (6.0 days), and in trade (7.2).

For further information, contact Ernest B. Akyeampong, Labour and Household Surveys Analysis Division. He can be reached at (613) 951-4624 or perspectives@statcan.ca.

Table 3: Occupation

Contributing factors by occupational absence rates are similar to those listed for industry. Again, as by industry, differences arose mainly from time lost due to illness or disability.

Full-time employees in health occupations (14.5), in occupations unique to production (11.0), and in trades, transport and equipment operator positions (10.1), recorded the most days lost in 2002.

Workers in managerial jobs (5.7), in natural and applied sciences (6.1), and in positions in culture and recreation (7.5) recorded the fewest days lost.

Table 4: Union coverage, job status, workplace size and job tenure

Full-time workers who belonged to unions or were covered by collective agreements missed almost twice as many workdays on average in 2002 for personal reasons as their non-unionized counterparts (12.7 versus 7.1).

Workers who considered their jobs to be permanent (and more likely to be unionized) lost on average more workdays (9.1) than those who said their jobs were not permanent (7.8).

Days lost tended to rise with firm size, increasing from a low of 7.6 in firms with fewer than 20 employees (firms more likely to have low union rates) to around 10.0 in firms with 100 or more (firms likely to have high union rates).

Days lost tended to rise with job tenure, with almost all the differences arising from sickness and disability. They rose from an average of 6.8 days among persons with tenure of up to one year to 10.8 among those with nine or more years (the latter group likely being older).

Table 5: Province and CMA

Work absence levels differed by geographic area, with most of the variation again arising from illness or disability.

Full-time employees in Nova Scotia and Saskatchewan lost on average most work time in 2002 (10.3 and 10.2 days). Those in Newfoundland and Labrador, Ontario, and Alberta (8.3) lost the least time.

Among the census metropolitan areas, workers in Thunder Bay, Regina, Gatineau, Trois-Rivières, Victoria, Windsor and Winnipeg lost the most workdays (an average of more than 10 days per full-time worker). Those in Hamilton (7.3), London (7.4), Calgary (7.7), and Kitchener-Waterloo (7.8) lost the least time.

Perspectives

Data source and definitions

The data in this article are annual averages from the **Labour Force Survey (LFS)**. They refer to full-time employees holding only one job. Part-time, self-employed and unpaid family workers are excluded because they generally have more opportunity to arrange their work schedules around personal or family responsibilities. Multiple jobholders, too, are excluded because it is not possible using LFS data to allocate time lost, or the reason for it, to specific jobs. Women on maternity leave are also excluded. Some human resource practitioners exclude persons on long-term illness or disability leave (exceeding one year) from their attendance management statistics. Such persons are, however, included in Statistics Canada's work absence estimates if they count themselves as employed (that is, they continue to receive partial or full pay from their employer). In 2002, the number of employed persons on such long-term illness or disability leave averaged only 22,000 in a typical week. Their exclusion would have reduced the weekly work absence incidence for illness or disability from 5.5% to 5.3%, the inactivity rate from 2.9% to 2.7%, and days lost per worker that year from 7.3 to 6.8.

Personal reasons for absence are split into two categories: 'own illness or disability' and 'personal or family responsibilities' (caring for own children, caring for elder relative, and other personal or family responsibilities). Absences for these two reasons represented about 28% of all time lost by full-time paid workers each week in 2002. Vacations, which accounted for about 44% of total time away from work, are not counted in this study, nor are statutory holidays, which represented 12%. Maternity leave represented 9% and other reasons, 6%.

The **incidence of absence** is the percentage of full-time paid workers reporting some absence in the reference week. In calculating incidence, the length of work absence—whether an hour, a day, or a full week—is irrelevant.

The **inactivity rate** shows hours lost as a proportion of the usual weekly hours of full-time paid workers. It takes into account both the incidence and length of absence in the reference week.

Days lost per worker are calculated by multiplying the inactivity rate by the estimated number of working days in the year (250).

Reasons for work absences in the LFS

The LFS sets out the following reasons for being away from work:

- own illness or disability
- caring for own children
- caring for elder relative (60 years or older)
- maternity leave (women only)
- other personal or family responsibilities
- vacation
- labour dispute (strike or lockout)
- temporary layoff due to business conditions
- holiday (legal or religious)
- weather
- job started or ended during week
- working short time (because of material shortages, plant maintenance or repair, for instance)
- other

As normally published, personal or family responsibilities consist of caring for own children, caring for elder relative, and other personal or family responsibilities.
