Highlights

The tables in this publication provide cancer incidence data for cases diagnosed in 2008 and 2009 for the provinces and territories. There are no national data to report for 2008 and 2009 at this time. The tables contain data based on the July 2011 CCR tabulation master file. Cancer incidence data for 1992 to 2009 are available on CANSIM. Trends and cancer estimates for 2011 based on these data are available in the Canadian Cancer Statistics 2011 monograph released in May 2011 by the Canadian Cancer Society.

About the Canadian Cancer Registry

The patient-oriented Canadian Cancer Registry evolved from the event-oriented National Cancer Incidence Reporting System established in 1969. The Canadian Cancer Registry is an administrative survey. Beginning with cases diagnosed in 1992, cancer incidence collected by provincial and territorial cancer registries have been reported to the Canadian Cancer Registry, which is maintained by Statistics Canada. The Canadian Cancer Registry has been developed to provide Canadian incidence and survival information required for cancer control. The Canadian Cancer Registry forms a personal information bank which is listed in the annual publication Info Source: Sources of Federal Government Information.

The Canadian Cancer Registry is a collaborative effort between the thirteen Canadian provincial and territorial cancer registries and the Health Statistics Division of Statistics Canada, where the data is housed. The data that come into the Canadian Cancer Registry describe both the individual with the cancer, and the characteristics of the cancer. The Canadian Council of Cancer Registries works with the cancer registries to establish national definitions and standards. Ultimate authority and responsibility for the degree of coverage and the quality of the data submitted to the Canadian Cancer Registry reside with the provinces and territories.

The Canadian Cancer Registry is a dynamic database of all Canadian residents alive or dead who have been diagnosed with cancer since 1992. The function of the Canadian Cancer Registry is to produce standardized and comparable cancer incidence and survival data for each newly diagnosed primary site of cancer. The Canadian Cancer Registry is a patient-based system that records the kind and number (incidence) of primary cancers diagnosed for each person until death. This system ensures that longitudinal data are available for each cancer patient. New primary cancers occurring for previous cancer patients are also identified. The patient data are regularly linked to the Canadian Mortality Data Base so that the date and cause of death of every cancer patient are eventually known.

In addition to information on cancer incidence, data are available about the characteristics of patients as well as about the nature and frequency of their tumour(s). Since patients' records remain active on the Canadian Cancer Registry until confirmation of death, survival rates for the various sites of cancer can be calculated.

The Canadian Cancer Registry also employs specialized software for internal record linkage to detect duplicate records and for death clearance to find death records. These procedures are done regularly. Conflicting information and other problems with the data uncovered by these processes are resolved through consultation with the reporting provinces and territories.

Objectives

The primary objective of the Canadian Cancer Registry is to provide a national database of information that can be used to study cancer patterns and trends and to monitor differences in cancer risks and survival among different populations in Canada.

Health-related statistics are used to provide accurate, timely and relevant information about the health of Canadians and the health care system. Statistics Canada provides statistical analyses and other information about the health of the population, the determinants of health, and the scope and utilization of Canada's health care resources. This information is used to assist and support health planners and decision-makers at all levels of government, to sustain demographic and epidemiological research, and to report to the Canadian public about their collective health and the health care system.

Content

Each provincial and territorial cancer registry records all cases of cancer among the population in its jurisdiction by combining information from multiple sources such as cancer clinic files and radiotherapy reports, records from in-patient hospitals, out-patient clinics and private hospitals, pathology and other laboratory/autopsy reports, radiology and screening program reports, reports from physicians in private practice, and reports on cancer deaths from Vital Statistics registrars.

Each year, approximately 145,000 new cancer tumour records are loaded on the Canadian Cancer Registry database. Subsequent changes to registry data due to errors or omissions are also transmitted to Statistics Canada, as the information becomes available in the cancer registries.

The Canadian Council of Cancer Registries, which oversees the Canadian Cancer Registry, recommends that the following tumours should be reported to the Canadian Cancer Registry:

1992 and onwards

- All primary, malignant tumours (ICD-O-3 topographies C00.0-C80.9 with behaviour codes of 3)*;
- All carcinoma in situ/intraepithelial/non-infiltrating/non-invasive tumours (ICD-O-3 topographies C00.0-C80.9 with behaviour codes of 2*); All borderline malignancies (ICD-O-3 topographies C00.0-C80.9 with behaviour codes of 1)*; Primary, benign tumours of the meninges, brain, spinal cord, cranial nerves, and other parts of the central nervous system (ICD-O-3 topographies C70.0-C72.9 with behaviour codes of 0)

2007 and onwards

- Primary, benign tumours of the pituitary, craniopharyngeal duct and pineal gland (ICD-O-3 topographies C75.1, C75.2, C75.3 with behaviour codes of 0);

* **EXCEPTIONS** (these are not reportable to the CCR):

1992 and onwards

- Cervix (ICD-O-3 topographies C53.0-C53.9) behaviour code 2
- Prostate (ICD-O-3 topography C61.9); behaviour code 2

Skin (ICD-O-3 topography C44 behaviour codes 1,2,3) for the following ICD-O-3 histology codes:

- 8050-8084 (squamous cell neoplasms)
- 8090 to 8110 (basal cell neoplasms)

2007 and onwards (in addition to the exceptions listed above),

Skin (ICD-O-3 topography C44 behaviour codes 1,2, 3) for the following ICD-O-3 histology codes:

- 8000-8005 (Neoplasms, not otherwise specified histology)
- 8010-8046 (epithelial neoplasms, not otherwise specified)

Patient records include nominal, demographic and mortality information about the person. Tumour records contain information about the characteristics of the tumour and its diagnosis.

1. To help with results interpretation, it is important to note that cancers reported to the Quebec Tumour Registry are those that required hospitalization or day surgery. Therefore, certain cases diagnosed and treated solely on an external or ambulatory basis are not reported to the Quebec Tumour Registry, or some cases are reported at a more advanced stage of the disease when hospitalization is required. A 2003 comprehensive study estimates, among other things, that more than a third of prostate cancers and melanomas are not reported to the Quebec Tumour Registry because of our reporting source. Overall, 90% of cancer cases confirmed by histopathology are reported to the Quebec Tumour Registry.

Note(s): See "Data quality, concepts and methodology — Explanatory notes for the tables" section. Please note that CANSIM table 103-0550 now provides incidence data for all primary cancer sites by five-year age-groups and also provides the crude rates per 100,000 population as well as their corresponding 95 % confidence intervals.

1. Ontario does not report in situ bladder cases to the Canadian Cancer Registry. Non-melanoma skin cancers are not registered in Ontario. Incidence for Kaposi's is heavily underestimated.

1. To help with results interpretation, it is important to note that cancers reported to the Quebec Tumour Registry are those that required hospitalization or day surgery. Therefore, certain cases diagnosed and treated solely on an external or ambulatory basis are not reported to the Quebec Tumour Registry, or some cases are reported at a more advanced stage of the disease when hospitalization is required. A 2003 comprehensive study estimates, among other things, that more than a third of prostate cancers and melanomas are not reported to the Quebec Tumour Registry because of our reporting source. Overall, 90% of cancer cases confirmed by histopathology are reported to the Quebec Tumour Registry.

Note(s): See "Data quality, concepts and methodology — Explanatory notes for the tables" section. Please note that CANSIM table 103-0553 no longer provides the crude rates per 100,000 population as well as their corresponding 95% confidence intervals. These data are now available in CANSIM table 103-0550.

Source(s): Statistics Canada, Canadian Cancer Registry (CCR) Database (July 2011 file) and Demography Division (population estimates) (CANSIM table 103-0553).

1. Ontario does not report in situ bladder cases to the Canadian Cancer Registry. Non-melanoma skin cancers are not registered in Ontario. Incidence for Kaposi's is heavily underestimated.

Note(s): See "Data quality, concepts and methodology — Explanatory notes for the tables" section. Please note that CANSIM table 103-0553 no longer provides the crude rates per 100,000 population as well as their corresponding 95% confidence intervals. These data are now available in CANSIM table 103-0550.

Explanatory notes for the tables

Table 1 New cases for all combined primary sites of cancer (based on the July 2011 CCR tabulation file)

World Health Organization, International Classification of Diseases for Oncology, Third Edition (ICD-O-3) and the International Agency for Research on Cancer (IARC) rules for determining multiple primaries sites.

Cancer incidence refers to new primary sites of malignant neoplasms. The Canadian Cancer Registry (CCR) is a dynamic database that can be updated with new records or changes to previous records, therefore, the incidence counts may vary from one release to the next.

The table was prepared using the Surveillance, Epidemiology and End Results (SEER) Groups for Primary Site based on International Classification of Diseases for Oncology, Third Edition (ICD-O-3). Included are all invasive sites and in situ for bladder.

The 95% confidence interval (CI) illustrates the degree of variability associated with a rate. Wide confidence intervals indicate high variability, thus, these rates should be interpreted and compared with due caution.

The tau-Arden suppression program, developed at Statistics Canada, is used to suppress low cell counts in cancer data. It suppresses table cells with a small count (from 1 to 5) and then iteratively suppresses additional cells to prevent calculation of the counts in suppressed cells from the released table data. The program suppresses a cell having the minimum value within the most promising class of equivalently-positioned cells at each iteration, but may suppress cells containing any count, including cells with a count of zero but excluding cells which are not applicable or not available. When a cell is suppressed, all measures of incidence (the number, the rate, and the confidence interval for the rate) are suppressed together.

Cancer incidence rates are age-standardized using the direct method and the 1991 Canadian Census population structure.

The confidence intervals for the age-standardized cancer incidence rates were produced using the method found in the following reference: Fay M.P. and E.J. Feuer. 1997. "Confidence intervals for directly standardized rates: a method based on the gamma distribution." *Statistics in Medicine*. Volume 16, pages 791 to 801.

The 95% confidence interval (CI) illustrates the degree of variability associated with a rate. Wide confidence intervals indicate high variability, thus, these rates should be interpreted and compared with due caution.

The tau-Arden suppression program, developed at Statistics Canada, is used to suppress low cell counts in cancer data. When a cell is suppressed, all measures of incidence (the number, the rate, and the confidence interval for the rate) are suppressed together.

The use of a standard population results in more meaningful incidence rate comparisons, because it adjusts for variations in population age distributions over time and across geographic areas.
