Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

User information

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0^s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the *Statistics Act*
- E use with caution
- F too unreliable to be published

Notice to readers

Most of the components used to produce preliminary population estimates are estimated using demographic models or based on data sources less complete or reliable, albeit more timely, than those used for updated or final estimates.

| 1. Quarterly aggregated demographic components, July to September, 1975 to 2009, Canada | 8 |
| 2. Quarterly variation of population estimates, Canada, provinces and territories, July to September, 2008 and 2009 | 9 |

Highlights

- On October 1, 2009, Canada's population was estimated at 33,873,400. In the third quarter, Canada's population grew by 133,500 (0.40%). Although down slightly from 2008, this was the strongest demographic growth at this time of the year since 1990.
- Net international migration (90,500) accounted for just over two thirds of Canada's population growth in the third quarter.
- For the first time since 1994, the estimated number of births for a quarter was more than 100,000. The annualized birth rate for the third quarter was the highest since 1998, for any quarter. It is the continuation of a trend that is also evident in many other developed countries.
- For the first time since 1994, Alberta suffered a third-quarter loss in interprovincial migration. Even so, its population grew by 0.44% from July to September.
- Newfoundland and Labrador (1982), Manitoba (1983), Yukon (1995) and Nunavut (1999) all posted their highest growth for a third quarter in as many years. That was also the case for Quebec (1988), Nova Scotia (1989) and New Brunswick (1991), where the strongest demographic growth, for any quarter, was noted.

Analysis

On October 1, 2009, Canada's population was estimated at 33,873,400. In the third quarter, Canada's population grew by 133,500 (0.40%). Although down slightly from 2008, this was the strongest demographic growth at this time of the year since 1990. Net international migration (90,500) accounted for just over two thirds of Canada's population growth in the third quarter.

While net international migration topped the 90,000 mark for the second straight year, it was down slightly from last year (92,400). The decline was largely due to the net number of non-permanent residents, which dropped from 32,100 to 26,200. Most of the decrease in the net number of non-permanent residents occurred in Alberta and Quebec. In contrast, Canada admitted 75,400 immigrants in the third quarter, the most for that period of the year since 2005. However, the increase in the number of immigrants was not enough to make up for the decline in the net number of non-permanent residents.

Chart 1

Quarterly aggregated demographic components, July to September, 1975 to 2009, Canada

Canada's natural increase in the third quarter was 43,000. In percentage terms, that is the largest increase since 1998, for any quarter, next to the level observed in the third quarter of 2008. The upward trend in natural increase was mainly attributable to a higher birth rate. For the first time since 1994, the estimated number of births for a quarter was more than 100,000. The annualized birth rate for the third quarter was the highest since 1998, for any quarter. It is the continuation of a trend that is also evident in many other developed countries.

Stronger demographic growth continues in the western provinces.

British Columbia had a higher population growth rate than any other province in the third quarter (0.56%). In addition to a sustained influx of immigrants, the province recorded its largest interprovincial migration gain (3,500) since the third quarter of 2007. That gain was also the largest interprovincial migration gain for any province from July to September.

Interprovincial migration loss for Alberta

For the first time since 1994, Alberta suffered a third-quarter loss in interprovincial migration. Even so, its population grew by 0.44% from July to September. While that is the province's lowest third-quarter population growth since 2000, it is still above the Canadian average. Since 1994, Alberta's quarterly population growth has invariably been higher than the national average.

From July to September, Saskatchewan's population grew by 0.47%. Just over half of the province's population increase was due to international migration. In percentage terms, it is the highest level of international migration for that period of the year since the current record-keeping system was introduced in 1971. The increase was mostly due to a higher number of immigrants from July to September.

In the third quarter, Manitoba posted its highest rate of population growth since 1983 (0.35%). The acceleration was primarily attributable to a sharp decline in interprovincial migration losses and higher international migration. Net interprovincial migration improved from -1,500 at the same time last year to -700, largely because of a substantial reduction in migration losses to Alberta, British Columbia and Ontario. Manitoba's net international migration rate of 10.2 per thousand was its highest third-quarter level since the current record-keeping system was introduced in 1971.

In the third quarter, Ontario had a population increase of 0.38%, mainly because of net international migration. Ontario's net interprovincial migration (-1,700) was at its highest level since 2002. In particular, Ontario reduced its interprovincial migration deficit with Alberta from 4,200 from July to September 2008 to 200.

Chart 2
Quarterly variation of population estimates, Canada, provinces and territories, July to September, 2008 and 2009

Quebec: Highest quarterly population growth rate since 1988

Quebec's population grew by 0.36% in the third quarter, primarily as a result of international migration. It is the province's highest quarterly demographic growth rate for any quarter since 1988. The acceleration in Quebec's population growth is largely attributable to a substantial decrease in interprovincial migration losses. For the first time since 1994, Quebec posted gains in its third-quarter migration exchanges with Alberta. Quebec's immigration rate of 8.0 per thousand was its highest for any quarter since 1991.

For the second consecutive quarter, every one of the Atlantic provinces had an increase in population. Interprovincial migration accounted for most of Newfoundland and Labrador's population growth, while international migration was the main contributor to the increases for the other three Atlantic provinces.

Newfoundland and Labrador posted its highest rate of third-quarter population growth since 1982 (0.26%). The acceleration was largely due to net international migration. Newfoundland and Labrador posted gains in its migration exchanges with the rest of the country for a fifth consecutive quarter. It is the third straight year that the province's population has grown in the third quarter.

From July to September, Prince Edward Island's population grew by 0.28%, despite losses in its migration exchanges with the rest of the country. It is the province's lowest third-quarter demographic growth rate since 2006. Prince Edward Island's net interprovincial migration was negative for a fourth consecutive quarter (-300). Nevertheless, fuelled by immigration, the international migration rate rose to its second-highest level for a third quarter (17.1 per thousand) since the introduction of the current record-keeping system, just behind the 2008 rate. The increase in net international migration offset the interprovincial migration losses, resulting in an increase in Prince Edward Island's population.

In the third quarter, Nova Scotia's population increased by 0.24%, its highest quarterly growth rate since 1989. The faster growth rate was attributable to an increase in net interprovincial migration. Nova Scotia recorded its largest interprovincial migration gains (300) from July to September since 1992. For the first time since 2003, the province posted gains in its quarterly migration exchanges with Alberta (200). From July to September, Nova Scotia also had its highest international migration rate from July to September (6.9 per thousand) since the introduction of the current record-keeping system.

New Brunswick's population increased by 0.13%, its highest quarterly growth rate for any quarter since 1991. An increase in net interprovincial migration accounted for the acceleration in the province's demographic growth. New Brunswick posted its first third-quarter gains in interprovincial migration exchanges since 1990. Moreover, with the exception of 2008, New Brunswick recorded its highest international migration rate (3.2 per thousand) for that period of the year since 1975, primarily due to immigration.

In the North

In northern Canada, the populations of Yukon and Nunavut increased in the third quarter, while the population of the Northwest Territories declined.

Mostly through interprovincial migration gains, Yukon's population grew 0.92% from July to September. It is the territory's highest third-quarter demographic growth rate since 1995. The faster population growth was also due to interprovincial migration, as its gains were the highest for that period of the year since 2003.

With the highest rate of natural increase in Canada, Nunavut's population grew by 0.78%. It is the territory's highest third-quarter demographic growth rate since it was established in 1999. The acceleration in its growth rate was mainly due to gains in exchanges with the other territories and the provinces, which were the highest they have been since the territory was established (100).

For a third consecutive year, the population of the Northwest Territories declined in the third quarter (-0.45%). The decline was primarily attributable to negative net interprovincial migration (-400). It is the territory's largest third-quarter interprovincial migration loss since 1987.

^p Preliminary data.

Note(s): Preliminary estimates based on data from the Canada Child Tax Benefit (CCTB) Program and F_{jk} factors calculated using 2005-2006, 2006-2007 and 2007-2008 tax file data from Canada Revenue Agency.

Methodology

This document describes the concepts, data sources and methodology used to produce the population estimates. Population estimates are produced to measure the population counts according to various characteristics and geographies between two censuses. Population estimates are the official figures used for the count of the population at the national, provincial and territorial levels.

Estimates of the population

Types of estimates

Population estimates can be either intercensal or postcensal. Intercensal estimates are produced using counts from two consecutive censuses adjusted for census net undercoverage (CNU)¹ (including adjustment for incompletely enumerated Indian reserves) and postcensal estimates. The production of intercensal estimates involves updating the postcensal estimates using the counts from a new census adjusted for CNU¹.

Postcensal estimates are produced using data from the most recent census adjusted for CNU¹ and the components of population growth. In terms of timeliness, postcensal estimates are more up-to-date than data from the most recent census adjusted for CNU¹, but as they get farther from the date of that census, they become more variable.

Levels of estimates

Updating population estimates between censuses entails the use of data from administrative files or surveys. The quality of population estimates therefore depends on the availability of a number of administrative data files that are provided to Statistics Canada by Canadian and foreign government departments. Since some components are not available until several months after the reference date, three kinds of postcensal estimates are produced: preliminary postcensal (PP), updated postcensal (PR) and final postcensal (PD). The time lag between the reference date and the release date is three to four months for preliminary estimates and two to three years for final estimates. Though it requires more vigilance on the part of users, the production of three successive series of postcensal estimates is the strategy that best satisfies the need for both timeliness and accuracy of the estimates. All tables indicate the level of the estimates they contain.

Calculation of population estimates

Population estimates – preliminary, updated and final – are produced by the component method. This method consists in taking the population figures from the most recent census, adjusted for census net undercoverage (CNU¹) (census undercoverage minus census overcoverage), and adding or subtracting the number of births, deaths, and components of international and interprovincial migration.

A. Provincial/territorial estimates of total population

Population estimates are produced for the provinces and territories first; then they are summed to obtain an estimate of the population of Canada.

The component-method formula for estimating total provincial/territorial populations is as follows:

1. In this case, the adjustment for the census net undercoverage also includes the incompletely enumerated Indian reserves

$$P_{(t+i)} = P_{(t)} + B_{(t,t+i)} - D_{(t,t+i)} + I_{(t,t+i)} - [E_{(t,t+i)} + \Delta TE_{(t,t+i)}] + RE_{(t,t+i)} + \Delta NPR_{(t,t+i)} + \Delta N_{(t,t+i)} - Resid_{(t,t+i)}$$

where, for each province and territory:

- (t,t+i) = interval between times t and t+i;
- $P_{(t+i)}$ = estimate of the population at time t+i;
- $P_{(t)}$ = base population at time t (census adjusted for (CNU¹), or most recent estimate);
- B = number of births;
- D = number of deaths;
- I = number of immigrants;
- E = number of emigrants;
- ΔTE = net temporary emigration;
- RE = number of returning emigrants;
- ΔNPR = net non-permanent residents;
- ΔN = net interprovincial migration;
- Resid = residual deviation (for intercensal estimates).

B. Levels of estimates

The difference between preliminary² and final postcensal population estimates lies in the timeliness of the components. When all the components are preliminary, the estimate is described as preliminary postcensal (PP). When they are all final, the estimate is referred to as final postcensal (PD). Any other combination of levels is referred to as updated postcensal (PR).

Base population and components of population growth

A. Base population

The base populations are derived from the quinquennial censuses between 1971 and 2006. The population universe of the 2006³ Census includes the following groups:

- Canadian citizens (by birth or by naturalization) and landed immigrants with a usual place of residence in Canada;
- Canadian citizens (by birth or by naturalization) and landed immigrants who are abroad, either on a military base or attached to a diplomatic mission;
- Canadian citizens (by birth or by naturalization) and landed immigrants at sea or in port aboard merchant vessels under Canadian registry;
- persons with a usual place of residence in Canada who are claiming refugee status and members of their families living with them;
- persons with a usual place of residence in Canada who hold Study Permits and members of their families living with them;
- persons with a usual place of residence in Canada who hold Work Permits and members of their families living with them;

For census purposes, the last three groups in this list are referred to as non-permanent residents (NPR).

2. Unless otherwise noted, the term *preliminary* include both preliminary and updated estimates.

3. From 1991 to 2001 Census, "persons with a usual place of residence in Canada who hold Minister's permits (including extensions) and members of their families living with them" were included in the census universe.

Foreign residents have not been enumerated since 1991. Foreign residents are persons who belong to the following groups:

- Government representatives of another country attached to the embassy, high commission or other diplomatic body of that country in Canada, and members of their families living with them;
- members of the Armed Forces of another country who are stationed in Canada, and members of their families living with them;
- residents of another country visiting Canada temporarily (for example, a foreign visitor on vacation or on business, with or without a visitor's permit).

These populations are adjusted as follows:

- adjustment of the population for census net undercoverage (CNU);
- addition of independent estimates for incompletely enumerated Indian reserves in 1991, 1996, 2001 and 2006;
- adjustment for early enumeration in 1991 and 1996 in parts of northern Quebec, Newfoundland and Labrador, the Yukon and the Northwest Territories;
- addition of estimates of NPRs in 1971, 1976, 1981 and 1986. Since 1991, NPRs are included in the census universe;
- estimation of the July 1 base population by addition or subtraction of the components of growth between Census Day and June 30. At the subprovincial level, the estimate of the July 1 base population is obtained by applying the subprovincial age-sex distribution of the adjusted census to the provincial / territorial population estimate.

Adjustment for census net undercoverage (CNU)

The adjustment for CNU is important. CNU is the difference between the number of persons who should have been enumerated but were missed (undercoverage) and the number of persons who were enumerated but should not have been or who were counted more than once (overcoverage).

Coverage studies provide undercoverage estimates for the 1991, 1996, 2001 and 2006 Censuses at the provincial and territorial levels, and for the 1971, 1976, 1981 and 1986 Censuses at the provincial level only. Estimates of overcoverage at the provincial and territorial levels are available only for the last four censuses (1991, 1996, 2001 and 2006). Overcoverage for previous censuses was estimated by assuming that the overcoverage-to-undercoverage ratio for each census between 1971 and 1986 was the same as in 1991. The CNU for the Yukon and the Northwest Territories prior to 1991 was estimated by assuming that the ratio between the CNU for each territory and the 10 provinces for each census between 1971 and 1986 was the same as in 1991.

For consistency, 1991 Census undercoverage and overcoverage were revised in 1998 to take into account the methodological improvements made in the 1996 Census coverage studies. This revision altered the CNU in all censuses between 1971 and 1986. Similarly, 1996 Census undercoverage and overcoverage were revised in 2003.

B. Births and deaths

Numbers of births and deaths are derived directly from the vital statistics database of Statistics Canada's Health Statistics Division. Although Statistics Canada manages the National system of vital statistics, the central vital statistics registries of the provinces and territories are responsible for collecting and processing the information from those administrative files. Under provincial/territorial vital statistics statutes (or similar legislation), all live births and all deaths must be registered, and all provinces and territories provide the information to Statistics Canada.

The vital statistics universe closely parallels the census universe. Both universes include births and deaths of all Canadians, immigrants and non-permanent residents (NPR) and exclude foreign residents.

Vital statistics by province or territory of residence are used to produce our final estimates of births and deaths.

When there are no vital statistics, the number of births is estimated using fertility rates by mother's age. The number of deaths is estimated using mortality rates by age and sex. These methods are used to calculate preliminary² estimates.

Special treatment for preliminary estimates for Quebec and British Columbia

Quebec and British Columbia provide their most recent estimates of births and deaths. The figures are used to produce preliminary² estimates. For the final estimates, the two provinces' births and deaths are derived from the vital statistics compiled by Health Statistics Division.

Levels of estimates

For information on the differences between preliminary² and final estimates, see sections **B. Births and deaths**, above.

C. Immigration

Like the numbers of births and deaths, Canadian immigration statistics must be kept by law. In Canada, immigration is regulated by the *Immigration and Refugee Protection Act* (IRPA) of 2002. This statute superseded the *Immigration Act*, which was passed in 1976 and amended more than 30 times in the years thereafter. *Citizenship and Immigration Canada* (CIC) collects and processes immigrants' administrative files. It then provides Statistics Canada with information from *Field Operational Support System* (FOSS) files. The information is used to estimate the number and characteristics of people granted permanent resident status by the federal government on a given date. For Demography Division, the terms immigrant and permanent resident are equivalent.

An immigrant is a person who is not a Canadian citizen by birth, but has been granted the right to live in Canada permanently by Canadian immigration authorities. The number of immigrants does not include persons born abroad to Canadian parents who are only temporarily outside the country.

Immigrants are usually counted on or after the date on which they are granted permanent resident status or the right to live in Canada.

Levels of estimates

The difference between preliminary² and final postcensal estimates lies in the timeliness of the source used to estimate this component. Since the FOSS file is continually being updated, new calculations are carried out each year to update the immigration estimates. Immigration estimates are preliminary the first year and updated the following year. They become final two years after the reference year.

D. Net non-permanent residents

Like the numbers of births and deaths, Canadian immigration statistics must be kept by law. In Canada, the non-permanent residents (NPR) are regulated by the *Immigration and Refugee Protection Act* (IRPA) of 2002. This statute superseded the *Immigration Act*, which was passed in 1976 and amended more than 30 times in the years thereafter. *Citizenship and Immigration Canada* (CIC) collects and processes the administrative files of immigrants and NPRs in Canada. It then provides Statistics Canada with information from *Field Operational Support System* (FOSS) files. The information is used to estimate the number and characteristics of people granted or permanent resident status by the federal government.

Non-permanent residents (NPR) are persons who are lawfully in Canada on a temporary basis under the authority of a temporary resident permit, along with members of their family living with them. Non-permanent residents (NPR) include foreign workers, foreign students, the humanitarian population and other temporary residents. The humanitarian population includes refugee claimants and temporary residents who are allowed to remain in Canada on humanitarian grounds and are not categorized as either foreign workers or foreign students. For Demography Division, the terms non-permanent resident and temporary resident are equivalent.

Estimates of the number of NPR are based on population estimates. The number of people in CIC's system is estimated on a specific date in each year of observation. First, the end-of-period population is estimated, and then the start-of-period population is subtracted from that estimate. That yields the net number of NPR.

Anyone who received non-permanent resident status prior to the observation date is counted. For refugee claimants, the date of their application is used. Permit holders and refugee claimants are excluded from the population if their permit has expired, if they receive permanent resident status, or if they are deported. In addition, refugee claimants are excluded if their file has been inactive for two years.

Since the FOSS file is continually being updated, the figures are recalculated for each new release period to update the estimates of the net number of NPRs in Canada. Non-permanent residents (NPR) estimates are preliminary the first year and updated the following year. They are finalized two to three years after the reference year, when all other components are also final.

Levels of estimates

The difference between preliminary² and final estimates lies in the timeliness of the source used to estimate this component. Since the FOSS file is continually being updated, the figures are recalculated for each new release period to update the estimates of the net number of NPRs. Non-permanent resident (NPR) estimates are preliminary the first year and updated the following year. They become final two to three years after the reference year.

E. Emigration

The number of emigrants is estimated using data from the *Office of Immigration Statistics, U.S. Department of Homeland Security*, data collected by the *Canada Child Tax Benefit (CCTB)* program, and data from the *T1 Family File (T1FF)*⁴. The first source is used to estimate emigration to the United States. CCTB data are used to estimate emigration to other countries. The estimates of the number of child emigrants have to be adjusted because the CCTB is not universal and does not provide direct information on the number of adult emigrants. As a result, four adjustment factors are used to take into account:

- incomplete coverage due to a delay in the receipt and processing of the files of children *eligible* for the CCTB. Since it seems to take four years after the reference period for CCTB administrative files to become complete, the adjustment is made if the estimates are finalized after two years. The factor is derived from the two-year ratios of emigrant children based on two versions of the CCTB files;
- the program's partial coverage, that is, people who do not apply for the CCTB or are not *eligible*. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;
- the differential propensity to emigrate between children who are *eligible* for the CCTB and children who are not. This factor is obtained by comparing the emigration rates of CCTB-eligible children with the rates for all children (aged 0-17). This factor is calculated for each province and territory and is based on the last three available years of T1FF⁴;
- the differential propensity to emigrate between adults and children. This factor generates the emigration rate for the population aged 18 and over. It is obtained by (1) calculating the average ratio over three years of the adult and child emigration rates based on T1FF⁴ data, (2) calculating the average ratio over three years of the adult and child emigration rates based on data from the *Office of Immigration Statistics, U.S. Department of Homeland Security*, and (3) taking the average of the two rates. This factor is calculated for Canada only.

The adult emigration rate is applied to the adult population to generate the number of adult emigrants, which is then added to the number of child emigrants to produce the number of emigrants for the entire population.

Emigration is disaggregated by province and territory based on the number of child emigrants adjusted for coverage and differential emigration.

Levels of estimates

4. The T1 family file (T1FF) is derived from the *Canada Revenue Agency (CRA)* T1 file by Small Area and Administrative Data Division of Statistics Canada.

The difference between preliminary² and final estimates lies in the timeliness of the sources used to estimate this component. The same estimation method is used.

F. Net temporary emigration

Some people leave Canada to live temporarily in another country; others who were temporarily outside Canada return. The net result of those departures and returns is the component known as “net temporary emigration”. Estimates of the number of departures are derived from the *Reverse Record Check* (RRC), the most important census coverage study. The RRC provides an estimate of the number of people who left Canada temporarily during an intercensal period and are still out of the country at the end of the period. Estimates of the number of returns are based on two sources: the Census and Demography Division’s estimates of returning emigrants. The census provides the number of people who were outside Canada at the time of the previous census and returned during the intercensal period. That number includes all returning emigrants. Then Demography Division’s estimate of the returning emigrants’ component is subtracted to produce the number of returning temporary emigrants. The estimated numbers of departures (RRC) and returns (Census and Demography Division) yield an estimate of net temporary emigration.

That estimate is for the whole intercensal period; it is disaggregated into estimates for each of the five years in the period and then into monthly estimates using a seasonal adjustment that is an average between zero seasonality and the seasonality of emigration.

Net temporary emigration is calculated first for the national level. It is then disaggregated by province or group of provinces based on the RRC estimates of temporary emigration. For the Atlantic provinces and the territories, the estimate for the group is disaggregated on the basis of each province/territory’s proportion of the group’s total population.

Net temporary emigration can be estimated only for the intercensal period preceding the most recent census. Net temporary emigration in the current period is assumed to be the same as in the previous period for each province and territory.

Levels of estimates

The difference between preliminary² and final estimates lies in the timeliness of the emigration estimate used to calculate the seasonal adjustment for the net temporary emigration. The same estimation method is used.

G. Returning emigrants

A returning emigrant is a person who returns to Canada after having been classified as an emigrant. In a manner similar to the procedure used to calculate the number of emigrants, data from the *Canada Child Tax Benefit* (CCTB) file and the *Canada Revenue Agency’s* (CRA) ’s T1FF⁴ are used to estimate the number of returning emigrants. Adjustment factors are applied to compensate for the fact that the CCTB program is not universal, and an adult/child ratio is used to estimate the number of adult returning emigrants. As a result, three adjustment factors are used to take into account:

- the program’s partial coverage, that is, people who do not apply for the CCTB or are not *eligible*. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;
- the differential propensity to emigrate between children who are *eligible* for the CCTB and children who are not. This factor is obtained by comparing the emigration rates of CCTB-*eligible* children with the rates for all children (aged 0-17). This factor is calculated for each province and territory and is based on the last three available years of T1FFs⁴;
- the adult/child ratio, which is based on the census used in estimating the base population.

Levels of estimates

The difference between preliminary² and final estimates lies in the timeliness of the sources used to estimate this component. The same estimation method is used.

H. Interprovincial migration

Interprovincial migration represents movements from one province or territory to another, involving a change in usual place of residence. As is the case for emigration, there is no provision for recording interprovincial migration in Canada. Consequently, such movements have to be estimated using data from the *Canada Child Tax Benefit* (CCTB) of *Canada Revenue Agency* (CRA) and the T1FF⁴.

Final estimates of interprovincial migration are obtained by comparing addresses indicated on personal income tax returns over two consecutive tax years. However, the migration status of taxfilers' dependants has to be imputed. An adjustment is also required to take into account migrants who do not file income tax returns. For 2001-2002 and subsequent years, the adjustment was slightly modified (for further information, see *Wilkinson, 2004*). From 2006-2007, this adjustment has slightly modified (Cyr, 2008 – Internal document).

Since income tax returns are not available at the time preliminary estimates are produced, the estimation of preliminary² interprovincial migration is based on CCTB administrative files, which provide counts of child migrants (aged 0-17) *receiving benefits* under the program. The estimates have to be adjusted later for children who are not receiving the CCTB. Finally, the number of adult migrants is calculated using the number of child migrants and factors derived from the T1FF⁴. As a result, three adjustment factors are used to take into account:

- the program's partial coverage, that is, people who do not apply for the CCTB or are not receiving *benefits*. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files;
- the differential propensity to migrate between children who are receiving the CCTB and children who are not. This factor is obtained by comparing the out-migration rates of children receiving the CCTB with the rates for all children (aged 0-17). This factor is calculated for each province and territory and is based on the last available year of T1FFs⁴;
- the differential propensity to migrate between adults and children. This factor generates the out-migration rate of the population aged 18 and over for each province/territory of origin and destination. It is obtained by calculating the ratio of the central migration rate for adults to the rate for children. It is estimated using data from the last three available years of T1FFs⁴.

The adult migration rate is then applied to the estimated adult population. The number of adult migrants is then added to the number of child migrants to produce the number of interprovincial migrants for the entire population.

Levels of estimates

For information on the differences between preliminary² and final estimates of total interprovincial migration, see section **H. Interprovincial migration** above.

Intercensal population estimates

Intercensal estimates – population estimates for reference dates between two censuses – are produced following each census. They reconcile previous postcensal estimates with the new census counts.

There are two main steps in the production of intercensal estimates:

- calculation of the error of closure;
- linear distribution of the error of closure.

Error of closure is defined as the difference between the postcensal population estimates on Census Day and the population enumerated in that census (after adjustment for census net undercoverage (CNU¹)).

The error of closure is spread uniformly over the intercensal period of days within each month.

Quality of estimates

The estimates contain certain inaccuracies stemming from two types of errors:

- errors in the census data;
- imperfections in other data sources and the method used to estimate the components.

Census data

A. Coverage, response and imputation errors

The errors attributable to census data can be divided into two groups: Response and processing errors, and coverage errors. The first group implies non-response error, misinterpretation by respondents, incorrect coding and non-response imputation. Errors in the second group primarily result from undercoverage and, to a lesser extent, overcoverage. It should be noted that both types of errors are intrinsic to any survey data.

The coverage errors occur when dwellings and/or individuals are missed, incorrectly included or counted more than once. Following each census, Statistics Canada undertakes coverage studies to measure these errors. The main studies are the *Reverse Record Check Survey* (RRC) and the *Census Overcoverage Study* (COS). Based on these studies, estimates of *census net undercoverage* (CNU) (which is equal to the difference between undercoverage and overcoverage) are produced. Demography Division adjusts the population enumerated in the census by province and territory using these estimates.

During the process of developing base populations, an attempt was made to correct only coverage errors in the population base. However, the correction based on the results of the coverage studies and on modeling of overcoverage for provinces and territories by age and sex prior to 1991, was also subject to sampling, collection, response and processing errors and uncertainty in the assumptions underlying the models. With respect to the coverage studies, statistical analysis concluded that the adjustment, although not without errors itself, improved the quality of census data (Royce, 1993). They were deemed to be consistent over time and across geographical areas, and to provide logical results. Users should also be aware that when calculating *census net undercoverage* (CNU) rates for small areas, it is likely that the underlying assumptions may be violated. If this is true, the resulting CNU rate would be misleading. Errors associated with these assumptions are, however, very difficult to quantify.

Nevertheless, the corrections to the census data due to CNU improved, in general, the quality of the estimates by compensating for the differential undercoverage by age, sex and by province/territory across censuses.

Text table 1
Estimated census net undercoverage, Canada, provinces and territories, 2001 and 2006 Censuses

Geography	Census population	Census net undercoverage	Incompletely enumerated Indian reserves	Adjusted population	Rate
	A	B	C	D=A+B+C	(B+C)/D*100
	number			in percent	
2001¹

Nunavut	29,474	1,264	0	30,738	4.11

1. The levels and rates are based on the Reverse Record Check (RRC) and the Overcoverage Study and include non-permanent residents.

The adjustment also incorporates the results of a study on the estimates of the number of people living on incompletely enumerated Indian reserves to complete the corrections for coverage errors in the census. The results of the coverage studies contain mainly sampling errors.

These adjustments have a direct impact on:

- the error of closure and its distribution by age and sex within a province or a territory as well as by province/territory as the CNU¹ and its distribution vary from one census to another;
- within-cohort consistency of population estimates. If for example, the male cohort in age group 0-4 in 1981 was tracked up to the 2001 Census (unadjusted for CNU¹) the age group 20-24 would be noticeably smaller in 2001 than the age group 15-19 in 1996. Since Canada receives many immigrants within these age groups, the opposite would be expected. However, only after adjustment for CNU¹, the cohort size increases from 1996 to 2001.

For further information regarding the main coverage studies, please see the following document on Statistics Canada's web site: 1996 and 2001 Census Technical Report on Coverage.

Components

Errors due to estimation methodologies and data sources other than the census can also be significant.

1. In this case, the adjustment for the census net undercoverage also includes the incompletely enumerated Indian reserves

A. Births and deaths

Since the law requires the recording of vital statistics, the final estimates for births and deaths data meet very high standards. Nevertheless, since preliminary estimates are derived, they can be slightly different from final estimates.

B. Immigration and non-permanent residents

With respect to immigrants and NPRs, Citizenship and Immigration Canada administers special data files on both of these components. Since immigration is controlled by law, data on immigrants and non permanent residents (NPRs) are compiled upon arrival in Canada. These data represent only “legal” immigration and exclude illegal immigrants. Thus, for the “legal” part of international movement into Canada, the data are considered to be of high quality. However, some biases such as the difference between the stated province of intended residence at the time of arrival and the actual province of residence, may persist. Finally, since information provided by the *Visitor Data System (VDS)* from *Citizenship and Immigration Canada (CIC)* is not complete (age and sex of dependents, province of residence for certain groups of permit holders), estimates of NPRs are more prone to error than data on immigrants.

C. Emigration, returning emigration and net temporary emigration

Of all the demographic components that are used in the population estimates program, these components are the most difficult to estimate with precision. Canada does not have a complete border registration system. While immigration and non permanent residents (NPRs) are well documented by the federal government, Statistics Canada has always used techniques of indirect estimation in the estimation of persons leaving the country. For this reason, available statistics regarding these three components have historically been of a lower quality than other components.

Estimates of the number of emigrants and returning emigrants are both derived using *Canada Child Tax Benefit (CCTB)* data provided by *Canada Revenue Agency (CRA)*. Data are adjusted to take into account the incomplete coverage of the program and to derive the emigration and returning emigration of adults.

These adjustments and the delay in obtaining the data are the two main sources of errors. As current information on the number of persons living temporarily abroad does not exist, estimates are based on the *Reverse Record Check (RRC)* and the census. Estimates for the intercensal period, distributed equally among the five years, are maintained constant for the postcensal period. Moreover, assumptions were made to allow for the distribution of annual estimates to a quarterly level. Any geographical or quarterly variation may introduce error in the estimation of these components.

D. Interprovincial migration

Since July 1993, preliminary² interprovincial migration estimates have been based on *Canada Child Tax Benefit (CCTB)* files. Under this program, only 76% of children aged 0-17 at the Canada level were entitled to benefits on July 1, 2001. Consequently, preliminary CCTB based estimates are subject to larger error than final estimates derived from *Canada Revenue Agency (CRA)* tax files.

Quality assessment

In order to assess the quality of our estimates, two evaluation measures are used: Precocity errors and errors of closure.

A. Precocity error

The quality of preliminary estimates of components is analyzed using precocity errors. Precocity error is defined as the difference between preliminary and final estimate of a particular component in terms of its relative proportion of the total population for the relevant geographical area. It can be calculated for both population and component estimates.

2. Unless otherwise noted, the term *preliminary* include both preliminary and updated estimates

Precocity error allows for useful comparisons between components, as well as between provinces and territories or geographical areas of different population size. Note that when compared to the total population for an area, the differences between preliminary and final estimates of the components are quite small. There are, however, differences in the amount of impact on the population estimates between components and between provinces and territories.

Generally speaking, net interprovincial migration yields the greatest precocity errors. This is likely the result of the use of different data sources for preliminary and final estimates. In most years and for most provinces/territories, births, deaths and immigration estimates yielded the smallest precocity errors. For immigration estimates, this reflects the completeness of the data source and the availability of data for the more timely preliminary estimates. In the case of births and deaths, small precocity errors support the use of short-term projections for preliminary estimates.

According to the analysis of the most recent precocity errors and assuming that the quality of the basic data remains constant, the present postcensal estimates should have an acceptable degree of reliability.

Text table 2
Quarterly precocity errors for components, Canada, provinces and territories

B. Error of closure

The error of closure measures the exactness level of the final postcensal estimates. It can be defined as the difference between the enumerated population of the most recent census (after adjustments for census net undercoverage (CNU¹)) and the most current postcensal population estimates as of Census Day.

The error of closure comes from two sources: The relative differences in the amount of CNU¹ and errors in the components of demographic growth over the intercensal period. This can be calculated for total population estimates and for age, sex and marital status. With each 5-year intercensal period, the error of closure can only be calculated with the release of census data and estimates of CNU¹.

By dividing the error of closure by the census population adjusted for CNU¹, the differences are relatively small at the national level (0.16% for 2001 and 0.32% for 2006). At the provincial and territorial level, differences are understandably larger, since the estimates are also affected by errors in estimating interprovincial migration. Nevertheless, the provincial/territorial final postcensal estimates generally fall within 1% of the adjusted census population, except for the territories that falls within closer adjustments.

Text table 3

Error of closure of the estimates of population, Canada, provinces and territories, 2001 and 2006

	2001		2006	
	number	rate in percent	number	rate in percent
Canada	49,948	0.16	105,352	0.32
Newfoundland and Labrador	11,381	2.18	-1,137	-0.22
Prince Edward Island	1,483	1.09	74	0.05
Nova Scotia	9,005	0.97	-2,778	-0.30
New Brunswick	4,587	0.61	3,404	0.46
Quebec	-222	0.00	26,088	0.34
Ontario	11,288	0.10	50,173	0.40
Manitoba	-1,035	-0.09	-5,396	-0.46
Saskatchewan	16,017	1.60	-3,061	-0.31
Alberta	1,604	0.05	-47,801	-1.40
British Columbia	-4,347	-0.11	88,057	2.08
Yukon	-360	-1.20	-979	-3.04
Northwest Territories	497	1.22	-875	-2.03
Nunavut	50	0.18	-417	-1.36

Note(s): The error of closure is equal to the postcensal estimate (at the census date) minus the census count adjusted for census net undercoverage (including adjustment for incompletely enumerated indian reserves). The percentage is: error of closure, divided by the census count adjusted for census net undercoverage and incompletely enumerated indian reserves, multiplied by 100.

Explanatory notes for the tables

Table 2 Quarterly population estimates and factors of growth, provincial perspective

Population	Population estimates are final postcensal for July 1, 2006, updated postcensal from October 1, 2006 to April 1, 2009 and preliminary postcensal from July 1, 2009.
Natural increase	Natural increase is final up to December 2006, updated from January 2007 to March 2009 and preliminary from April 2009.
International migration	Net international migration numbers are updated from July 2006 to March 2009 and preliminary from April 2009.
Interprovincial migration	Net interprovincial migration numbers are final up to June 2008 and preliminary from July 2008.
Total migration	Total net migration numbers are updated from July 2006 to March 2009 and preliminary from April 2009.
Total growth	Numbers for total growth are updated from July 2006 to March 2009 and preliminary from April 2009.

Table 3 Quarterly estimates of demographic components, provincial perspective, provincial perspective

Birth	The numbers of births are final up to December 2007, updated from January 2008 to March 2009 and preliminary from April 2009.
Death	The numbers of deaths are final up to December 2006, updated from January 2007 to March 2009 and preliminary from April 2009.
Immigrant	The numbers of immigrants are final up to December 2007, updated from January 2008 to March 2009 and preliminary from April 2009.
Emigrant	The numbers of emigrants are updated from July 2006 to March 2009 and preliminary from April 2009.
Returning emigrant	The numbers of returning emigrants are updated from July 2006 to March 2009 and preliminary from April 2009.
Net temporary emigrant	The numbers of net temporary emigrants are updated from July 2006 to March 2009 and preliminary from April 2009.
Net non-permanent resident	The numbers of net non-permanent residents are updated from July 2006 to March 2009 and preliminary from April 2009.
In-migrant	The numbers of interprovincial in-migrants are final up to June 2008 and preliminary from July 2008.
Out-migrant	The numbers of interprovincial out-migrants are final up to June 2008 and preliminary from July 2008.

Appendix I

Glossary

Annualized rate

Refers to the ratio of the estimated number of events converted to an annual basis divided by the average quarterly populations. In this respect, birth, death, immigration rates, etc are calculated. Generally, the rate is expressed in per 1,000.

Census coverage

Census netundercoverage: Difference between undercoverage and overcoverage.

Overcoverage: Number of persons who should not have been counted in the census or who were counted more than once.

Undercoverage: Number of persons who were intended to have been enumerated in a census but were not enumerated.

Components of demographic growth

Any of the classes of events generating population movement variations. Births, deaths and migrations are the components responsible for the variation since they alter the total population.

Emigrant

Canadian citizen or **immigrant** who has left Canada to establish a permanent residence in another country.

Error of closure

Difference between the **postcensal estimate** for the same date as the census and the results of the census adjusted for **censusnet undercoverage** (including adjustment for incompletely enumerated Indian reserves).

Immigrant

Within the framework of this publication, the term immigrant refers to **landed immigrant**. A landed immigrant is a person who does not have Canadian citizenship but was granted the right by immigration authorities to live in Canada on a permanent basis.

International migration

International migration represents movement of population between Canada and a foreign country which involves a change in the usual place of residence. A distinction is made with regard to **immigrants, emigrants, returning emigrants, net temporary emigrants** and **net non-permanent residents**.

Interprovincial migration

Interprovincial migration represents movement from one province or territory involving a permanent change in residence. A person who takes up residence in another province or territory is an **out-migrant** with reference to the province or territory of origin and an **in-migrant** with reference to the province or territory of destination.

Natural increase

Variation in population size over a given period as a result of the difference between the numbers of births and deaths.

Net international migration

Net international migration is obtained according to the following formula:

Immigrants + returning emigrants + net non permanent residents – (emigrants + net temporary emigrants)

Net interprovincial migration

Net interprovincial migration represents the difference between *in-migrants* and *out-migrants* for a given province or territory.

Net non-permanent residents

Net non-permanent residents represent the variation in the number of non-permanent residents between two dates.

Non-permanent residents

A non permanent resident belongs to one of the five following groups:

- persons residing in Canada claiming refugee status;
- persons residing in Canada who hold a study permit;
- persons residing in Canada who hold a work permit;
- persons residing in Canada who hold a minister's permit;
- all non-Canadian born dependants of persons claiming refugee status, or of persons holding study permits, work permits or minister's permits and living in Canada.

Net temporary emigration

Net temporary emigration represents the variation in the number of temporary emigrants between two dates. Temporary emigration includes Canadian citizens and *immigrants* living temporarily abroad who have not maintained a usual place of residence in Canada.

Population

Estimated population and population according to the census are both defined as being the number of Canadians whose usual place of residence is in that area, regardless of where they happened to be on Census Day. Also included are any Canadians staying in a dwelling in that area on Census Day and having no usual place of residence elsewhere in Canada, as well as those considered *non-permanent residents*.

Population estimate

Postcensal: Population estimate produced by using data from the most recent available census adjusted for *census net undercoverage* (including adjustment for incompletely enumerated Indian reserves) and estimate of the *components of demographic growth* since that last census. This estimate can be preliminary, updated or final.

Intercensal: Population estimate derived by using *postcensal estimates* and data adjusted for *censusnet undercoverage* (including adjustment for incompletely enumerated Indian reserves) of censuses preceding and following the year in question.

Population growth or total growth

Variation of population size between two dates. It can also be obtained by summing the *natural increase*, *total net migration* and if possible, subtract *residual deviation*. It can be positive or negative.

Residual deviation

Difference between demographic *population growth* calculated using *intercensal estimates* of population between two dates and that obtained by the sum of the components for the same period. This deviation results from the distribution of the *error of closure* between years within the quinquennial period. This distribution is calculated by taking into account the number of days within each month.

Returning emigrant

Canadian citizen or *immigrant* having previously emigrated from Canada and subsequently returned to the country.

Total net migration

Sum of *net international* and *net interprovincial* migration.

Vital events

Includes all the demographic events (that is to say births, deaths, marriages and divorces) for which there exist a legal requirement to inform the Provincial or Territorial Registrar's Office.

Appendix II

Source and remarks

Base population

May 16, 2006 Census of Population adjusted for census net undercoverage and incompletely enumerated Indian reserves.

2006 Census: Statistics Canada, Census of Canada, 2006, Catalogue no. 92-200-XPB.

Census net undercoverage: See The Daily, September 29, 2008.

Incompletely enumerated Indian reserves: See The Daily, September 29, 2008.

Births and deaths

Statistics Canada, Health Statistics Division.

Statistics Canada, Demography Division, Catalogue no. 91-002-X, Quarterly, Analytical table.4.

Immigration

Citizenship and Immigration Canada.

Emigrants

Statistics Canada, Demography Division - from data on emigrant children from the Canada Child Tax Benefit program (CCTB) from Canada Revenue Agency files - CRA and data from the « U.S. Department of Homeland Security, Office of Immigration Statistics ».

Returning emigrants

Statistics Canada, Demography Division – based on data from the CCTB program and adjustment factors calculated using CRA files.

Net temporary emigrants

Statistics Canada, Demography Division – based on data from the Reverse Record Check (RRC), 2001 and 2006 Censuses of Canada.

Non-permanent residents

Statistics Canada, Demography Division – based on data provided by Citizenship and Immigration Canada.

Interprovincial migration

Statistics Canada, Demography Division – based on the CTB program and adjustment factors calculated using CRA files.
