Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

User information

Symbols

The following standard symbols are used in Statistics Canada publications:

- . not available for any reference period
- .. not available for a specific reference period
- ... not applicable
- 0 true zero or a value rounded to zero
- 0s value rounded to 0 (zero) where there is a meaningful distinction between true zero and the value that was rounded
- p preliminary
- r revised
- x suppressed to meet the confidentiality requirements of the Statistics Act
- E use with caution
- F too unreliable to be published

Notice to readers

Most of the components used to produce preliminary population estimates are estimated using demographic models or based on data sources less complete or reliable, albeit more timely, than those used for updated or final estimates.

Highlights

- As of July 1, 2010, Canada's population was estimated to be 34,108,800. This represents an annual growth rate
 of 1.1% during the period 2009/2010, slightly slower than in 2008/2009 (1.2%).
- About two-thirds of Canada's growth during the 2009/2010 period was due to net international migration. The
 number of immigrants to Canada increased from 245,300 in 2008/2009 to 270,500 in 2009/2010 but a decreased
 net flow of non-permanent residents (71,300 in 2008/2009 falling to 33,100 in 2009/2010), resulted in the overall
 lower net international migration in 2009/2010 than in the previous year.
- Nunavut had the highest growth rate in Canada during the 2009/2010 period at 3.1%. Among the provinces, the growth rate in 2009/2010 was above that of the nation overall in Saskatchewan (1.6%), British Columbia (1.6%), Alberta (1.4%) and Manitoba (1.3%).
- The median age of the Canadian population on July 1, 2010 was 39.7 years, an increase of 0.2 years compared to one year earlier, and up from 26.2 years in 1971.
- As of July 1, 2010, seniors aged 65 years and over accounted for 14.1% of the Canadian population while 16.5% of the population was comprised of children aged 14 years and under. In 1971, it was 8.0% and 29.3%, respectively.
- Across Canada, the lowest median age was in Nunavut (24.6 years) and among the provinces it was lowest in Alberta (35.8 years). The highest median age of the country was found in Newfoundland and Labrador (43.3 years).
- Nova Scotia had the highest proportion of the population aged 65 and over (16.0%). Newfoundland and Labrador, along with Nova Scotia, had the lowest proportion of children in the country (14.8% each).

Section 1

Total

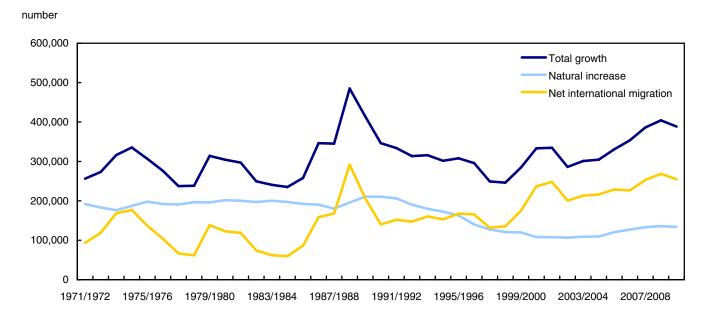

On July 1, 2010, population of Canada the reached 34,108,800, uр 388,600 people from the previous year, a growth rate of 1.1%. Although slightly slower than the 1.2% growth rate of the 2008/2009 and 2007/2008 periods, was higher than the growth throughout the 1992/1993 to 2006/2007 period when it ranged between 0.8% to just below 1.1%.

Net international migration¹, comprised primarily of the difference between immigrants who entered Canada and emigrants who left the country, remained a major contributor to population growth. About two-thirds of Canada's growth during the 2009/2010 period was due to net international migration (65.6%). Although net international migration was lower in 2009/2010 (254,700) than

in 2008/2009 (268,400), it was higher than it had been during the 1989/1990 to 2007/2008 period. The number of immigrants to Canada increased from 245,300 in 2008/2009 to 270,500 in 2009/2010 but a decreased net flow of non-permanent residents (71,300 in 2008/2009 falling to 33,100 in 2009/2010) resulted in the overall lower net international migration in 2009/2010 than in the previous year.

The second component of population growth at the national level is natural increase which refers to the difference between the number of births and deaths. In 2009/2010 there were estimated to be 381,400 births and 247,600 deaths, resulting in 133,800 people added to the population because of natural increase. This accounted for just over one-third (34.4%) of population growth during this period. Similar to net international migration, the number of people added to the population through natural increase in 2009/2010 was slightly lower (by about 2,000 people) than in 2008/2009 but it was higher than throughout the 1997/1998 to 2007/2008 period.

Chart 1.1 Annual factors of demographic growth, 1971/1972 to 2009/2010, Canada

Net international migration is the sum of immigrants, returning emigrants and net non-permanent residents minus emigrants and net temporary emigrants.

While population growth at the national level is the result of net international migration and natural increase, growth in each of the provinces and territories is determined by not only these two components but also by net interprovincial migration. Consequently there can be much variation across the provinces and territories of the country. The western provinces of Manitoba, Saskatchewan, Alberta and British Columbia, as well as the Yukon and Nunavut territories had a growth rate in 2009/2010 that was stronger than that of Canada overall. The growth rate was slower than that of the total Canadian population in the Atlantic provinces and in the Northwest Territories while it was closer to the national figure in Ontario and Quebec.

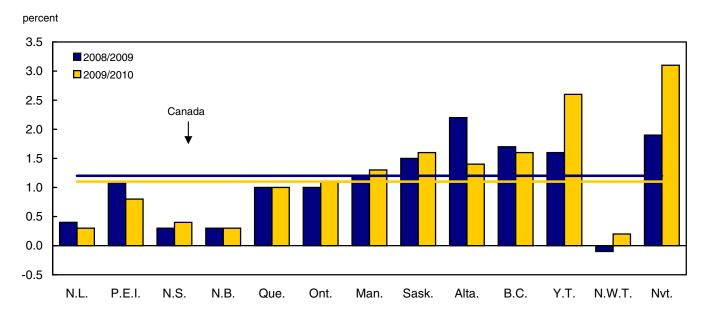

Population growth remains strong in western provinces

Saskatchewan, along with British Columbia, had the highest annual growth rate among all the provinces in the 2009/2010 period at 1.6%. This was the highest growth rate for Saskatchewan since 1971, the beginning of the period covered by the current record-keeping system. As of July 1, 2010 Saskatchewan had a population of 1,045,600 resulting from 16,500 people being added during the previous year. Contributing to the high growth rate in this province was positive

migratory exchanges from both international migrants as well as interprovincial migrants. Although slightly lower than 2008/2009, net international migration to Saskatchewan in 2009/2010 (7,800) contributed to the strong growth in this province. The number of immigrants who came to Saskatchewan in 2009/2010 was the highest recorded for the province (7,300) since 1971 and more than offset the fall in the net flow of non-permanent residents from 2008/2009 to 2009/2010 (2,300 to 900).

Net interprovincial migration added 3,900 people to the population of Saskatchewan, up from 3,000 the previous year. This was the fourth consecutive year of positive net interprovincial migration to Saskatchewan following more than 20 years of negative net interprovincial migration (1984/1985 to 2005/2006). Most of Saskatchewan's net inflows of interprovincial migration came from its exchanges with Ontario (1,900) and Alberta (1,100). Natural increase was also higher in 2009/2010 (4,800 people) than in the previous year and was the highest it had been since 1995/1996. Close to half of the growth during the 2009/2010 period in Saskatchewan was attributed to international migration (47.5%), nearly one-quarter (23.7%) was the result of net interprovincial migration and 28.8% was due to natural increase.

Chart 1.2 Demographic growth rate, 2008/2009 and 2009/2010, Canada, provinces and territories

British Columbia added 70,700 people to the population of its province to reach 4,531,000 on July 1, 2010. This growth rate of 1.6% was well above the national level (1.1%) during the 2009/2010 period. Although the growth rate was lower than the two preceding years (2008/2009 and 2007/2008), higher remained than throughout the 1997/1998 to 2005/2006 period. Accounting for the slightly slower growth in 2009/2010 was the drop in net flows from non-permanent residents from 17,700 in 2008/2009 to 11,300 in 2009/2010. the same period, the number immigrants to British Columbia increased slightly from 42,400 in 2008/2009 to 43,800 in 2009/2010.

Overall, there were 48,000 people added to the population of British Columbia in 2009/2010 as a result of net international migration, 13,300 from natural increase and 9,400 from net interprovincial migration, many of whom came from Alberta (3,800) and Ontario (3,100). Consequently, more than two-thirds (67.9%) of the growth was driven by net international migration, while 13.3% was the result of net flows from interprovincial migration and an additional 18.9% of the growth could be attributed to natural increase.

As of July 1, 2010, the population of Alberta was 3,720,900 resulting from the addition of 50,200 people during the previous year – a growth rate of 1.4%, higher than that of Canada overall, but the province's lowest growth rate since 1994/1995. Between 1996/1997 and 2008/2009, Alberta had the highest growth rate among the provinces in Canada for all but one year (Ontario had the strongest growth rate in 2000/2001). In 2009/2010, among the provinces Alberta placed third in terms of growth rate behind Saskatchewan and British Columbia.

Unlike the other provinces, most of Alberta's growth in 2009/2010 could be attributed to natural increase (61.6%), with 30,900 more births than deaths. Net migratory exchanges resulted in the remaining population growth, which was driven by the net flow of 21,500 international migrants. An important component of net international migration was the rise in the number of immigrants from 25,200 in 2008/2009 to 30,000 in 2009/2010 especially given that net flows of non-permanent residents fell from 19,200 to close to -100 during the same time period. In addition, net interprovincial migration was negative in Alberta in 2009/2010 (-2,200) for the first time since 1994/1995 and following a peak in 2005/2006 (45,800).

The province of Manitoba had its highest growth in 2009/2010 since 1982/1983. The population as of July 1, 2010 was 1,235,400, adding 15,900 people during the preceding year, a growth rate of 1.3%. Net international migration (1,200) in 2009/2010 was the highest observed in Manitoba since 1971. The province received close to 14,100 immigrants in 2009/2010, the fourth consecutive year for which the province recorded more than 10.000 immigrants. This could reflect Manitoba's use of the Provincial Nominee Program which is an economic program developed to allow provinces to select immigrants who possess relevant training, work experience and language skills. Net interprovincial migration remained negative in 2009/2010 (-2,200) with most net outflows to British Columbia (-1,200) and Saskatchewan (-800), but there were fewer losses than in the preceding 10 years. In addition, the number of people added to the population through natural increase (5,500) was the highest since 1995/1996.

Atlantic provinces continue to grow slowly

In the Atlantic provinces, Newfoundland and Labrador, Nova Scotia and New Brunswick set records in 2009/2010 in their respective provinces for the lowest natural increase, although they continued to have positive overall growth. The overall downward trend in natural increase for these provinces was already observed in 1971, the beginning of the period covered by the current record-keeping system.

Newfoundland and Labrador added about 1,600 people to the province's population to reach 509,700 on July 1, 2010. This accounted for a 0.3% population growth rate in 2009/2010, similar to New Brunswick. Although the growth rate in Newfoundland and Labrador was lower than during the 2008/2009 period (0.4%), it was much higher than the negative population growth rates of the 1990s and early 2000s when the population was actually decreasing in size. The growth during 2009/2010 represents the third consecutive year of population increase for Newfoundland and Labrador. However, the July 1, 2010 population of Newfoundland and Labrador was still well below the 1992 population peak of 580,100.

In 2009/2010, there were close to 300 more deaths than births in Newfoundland and Labrador, reflecting a population with both low fertility and a high proportion of seniors. Across Canada, Newfoundland and Labrador, along with Nunavut, were the only two regions where more growth was attributed to interprovincial migration

than to international migration. In Newfoundland and Labrador, more than 1,300 people were added to the population as a result of net interprovincial migration, primarily from Ontario, while close to 600 were added from net international migration.

Similar to Newfoundland and Labrador, the population growth rate was lower in 2009/2010 compared to the previous year for Prince Edward Island. In 2009/2010, 1,200 people were added to the population of Prince Edward Island, a growth rate of 0.8% resulting in a total population on July 1, 2010 of 142,300. For the second consecutive year, Prince Edward Island had the highest rate of net international migration across the country. In fact, there was a net flow of 1,900 international migrants to Prince Edward Island in 2009/2010. Overall growth due to the net migratory exchange was reduced, however, by negative net interprovincial migration (-900) with net outflows mostly to Ontario (-300) and British Columbia (-300). Close to 200 people were added as the result of natural increase.

The growth rate in Nova Scotia in 2009/2010 was 0.4%, stronger than that of 2008/2009 (0.3%) and the highest growth rate for the province since 1992/1993. In Nova Scotia, 3,400 persons were added to the population in 2009/2010, producing a population of 942,500 on July 1, 2010. Population growth during 2009/2010 was entirely due to positive net migratory exchanges, primarily net international migration. During the 2009/2010 period 3,200 people were added to the population from net international migration, primarily immigration (2,400). Additionally, there was a net flow of 200 interprovincial migrants to the province in 2009/2010.

In New Brunswick, 2,400 persons were added to the population in 2009/2010, representing a growth rate of 0.3%, the same as in 2008/2009 and the highest since the 1991/1992 period. This growth resulted in a population of 751,800 as of July 1, 2010. Close to three-fifths of this growth (57.9%) was due to international migration, adding 1,400 people to the population in 2009/2010. An additional 300 people were added due to natural increase. Although both international migration and natural increase were lower than in the previous several years, growth was also supplemented by positive net interprovincial migration (700) for the first time since 1990/1991, with net inflows mainly from Alberta (600).

Quebec and Ontario grow faster than previous year

In 2009/2010, 79,000 people were added to Quebec's population reaching a total population of 7,907,400 on July 1, 2010. This growth rate of 1.0% during the 2009/2010 period was the highest since 1989/1990. The largest component of growth in Quebec in 2009/2010 was from net international migration (51,500 people). In fact, Quebec received in 2009/2010 its highest number of immigrants (51,500) since 1991/1992, which helped compensate for a reduced net flow of non-permanent residents (7,100) compared to the previous year (13,200).

Positive net international migration also offset negative net interprovincial migration (-3,300), especially due to net outflows to Ontario (-1,900) and British Columbia (-700). While net interprovincial migration has been negative since at least 1971, the beginning of the period covered by the current record-keeping system, the net loss was less than half the number from 2008/2009 (-7,400). There were 30,800 more births than deaths in Quebec in 2009/2010, down from 2008/2009, but higher than throughout the 1996/1997 to 2007/2008 period. Although similar in 2009/2010 and 2008/2009, the number of births has been growing in recent years, at least partially reflecting an increase in the total fertility rate in this province.

The most populous province Canada, in Ontario, added 145,800 people to its population between July 1, 2009 and July 1, 2010, to 13,210,700, а growth rate of the same as the national level. Ontario's net international migration of 106,100 personnes was the highest observed since the 2005/2006 period. The immigrants number of increased from 105,400 in 2008/2009 to 116,500 in 2009/2010 but the net flow of non-permanent residents fell from 16,100 to 11,700 during the same period. Although more people left Ontario for other regions of Canada in 2009/2010 than arrived (-7,300), the loss was less than half that of 2008/2009 (-15,600) and less of a deficit than in the previous five years. Ontario's net outflows of interprovincial migration were mostly in the direction of British Columbia (-3,100) and Alberta (-2,100). Overall, net migratory exchanges, both international and interprovincial, accounted for more than two-thirds of the population growth in Ontario during the 2009/2010 period, and added about 98,800 people to province. In terms of natural increase, 46,900 people were added to the population in 2009/2010, the lowest it had been since 2002/2003.

Across Canada, growth rate highest in Nunavut

Given that the territories have relatively small populations, small fluctuations in their population can substantially affect their growth rates. Nunavut added more than 1,000 people to its population in 2009/2010 to reach 33,200 on July 1, 2010. The growth rate during the 2009/2010 period was 3.1%, the highest since 1993/1994. Given the high fertility in this territory, it was primarily natural increase that accounted for the population growth (700 more births than deaths), followed by interprovincial migration (a net inflow of 400 people, more than 100 of whom were from Quebec).

In the Yukon, close to 900 people were added to the population in 2009/2010 resulting in an overall population on July 1, 2010 of 34,500, a growth rate of 2.6%. While close to 400 people were added

through net international migration (including a net flow of 100 non-permanent residents), more than 300 people were added from net interprovincial migration (more than 100 people added from the territory's exchange with Alberta), both up from previous years. With a lower total fertility rate, natural increase contributed less to growth in the Yukon compared to the other territories, but it still added close to 200 people to the population.

As of July 1, 2010 the population of Northwest Territories reached 43,800. Although 600 people were added to its population through natural increase, the territory lost close to 500 through net interprovincial migration, mainly in the direction of Alberta and British Columbia. With only a small net inflow of international migrants, preliminary estimates showed that fewer than 100 people were added to the overall population the Northwest Territories in 2009/2010, resulting in a growth rate of 0.2%.

Section 2

Age and sex

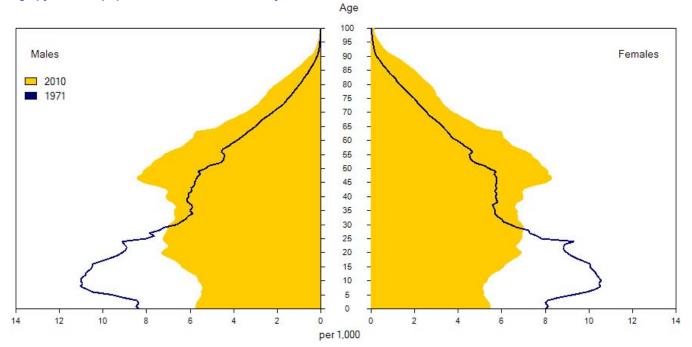

A population pyramid provides a visual snapshot of the age and sex structure of a population. The population pyramid for Canada as of July 1, 2010 shows the large cohort of baby boomers, born between 1946 and 1965, currently in the 45 to 64 year age range. The progression of the baby boomers through the age structure is particularly evident when comparing the July 1, 2010 pyramid to that of July 1, 1971. Nearly 40 years earlier, the baby boomers were children and young adults aged approximately 6 to 25 years. This large cohort will continue to shift upward and will

eventually age out of the population pyramid, leaving, at the end, a more rectangular-shaped age structure.

A comparison of the July 1, 2010 and July 1, 1971 pyramids also clearly shows the impact of low fertility at the base of the pyramid and increasing life expectancy at the oldest ages. Also apparent from the age pyramid is the increase in the population at the youngest ages, roughly age 0 to 2 years of age on July 1, 2010. In recent years there has been a growing population of women in their prime childbearing years of twenties to early thirties as well as an increase in the total fertility rate. Consequently, more babies are being born and the base of the pyramid has become broader.

Figure 2.1

Age pyramid of population estimates as of July 1, 1971 and 2010, Canada

The aging of the Canadian population can be measured using indicators of median age—the age at which 50% of the population is older and 50% is younger—as well as the proportion of the population which is aged 65 years and over. These are the most widely used indicators of aging and allow for international

comparisons. The proportion of children aged 14 years and under in the population can also provide an indication of the aging of the population to the extent that as older age groups assume larger shares in the population, proportions of children will be lower.

The median age of the Canadian population on July 1, 2010 was 39.7 years, an increase of 0.2 years compared to one year earlier. In 1971, the beginning of the period covered by the current record-keeping system, the median age was 26.2 years. The rise in the median age is the result of below replacement fertility rates for the last several decades, combined with an increasing life expectancy and the aging of the large baby boom cohort. According to the medium growth scenario of the most recent demographic projections, the median age could reach 44.0 years by 2040.

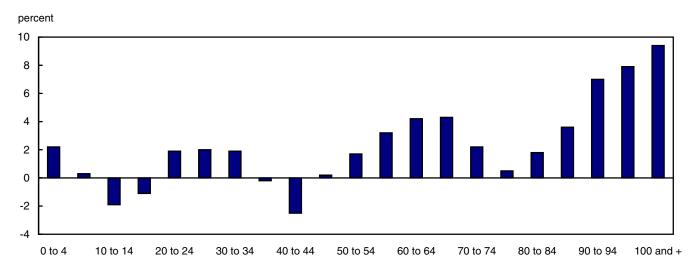

The senior population continues to grow

As of July 1, 2010, 4,819,600 seniors aged 65 and over accounted for 14.1% of the Canadian population, up from 13.9% one year earlier. In 1971, 8.0% of the population were seniors and there has been a steady increase during the last forty years. Population aging in Canada is expected to accelerate between 2011 and 2031, as all people in the large cohort of baby boomers reach their senior years. Projections show that seniors could account for more than one-fifth of the population as soon as 2026 and could exceed one-quarter of the population by 2056.

Chart 2.1
Demographic growth rate by age group, 2009/2010, Canada

Compared with 2008 to 2010 data from other Organization for Economic Co-operation and Development (OECD) countries, the proportion of Canadian seniors remained below levels in Japan (22.7%), Germany (20.4%), France (16.6%) and the United Kingdom (16.1%), but slightly higher than Australia (13.3%) and the United States (12.9%). Given the sizeable demographic weight of the baby boom cohort in Canada, the share of the senior population in this country could surpass that of some other nations in the coming years.

As of July 1, 2010, there were 1,333,800 people aged 80 years and over in Canada, representing 3.9% of the total population. The number of people aged 80 years and over could double by the year 2031 and by 2061—the end of the projection period of the most recent projections—there could be 5.1 million people in this age range. The nation also had an estimated 6,500 people aged 100 years and over on July 1, 2010, the fastest growing age group during the 2009/2010 period. In 2001, they numbered 3,400. It is projected that there could be 15,000 centenarians at the beginning of the 2030s, and by 2061 it could reach 78,300.

There were roughly equal proportions of men and women in each age group under 65 years however the disparity grows throughout the senior years. For the total population 65 years and over, 55.6% were women on July 1, 2010, increasing to 63.0% for those aged 80 years and over and to 79.6% for centenarians. Much of this sex difference is due to a higher life expectancy for women compared to men. In recent years, however, gains in life expectancy have been more rapid for men than for women, resulting in a narrowing of the gap between the sexes.

Population of older working-age increases

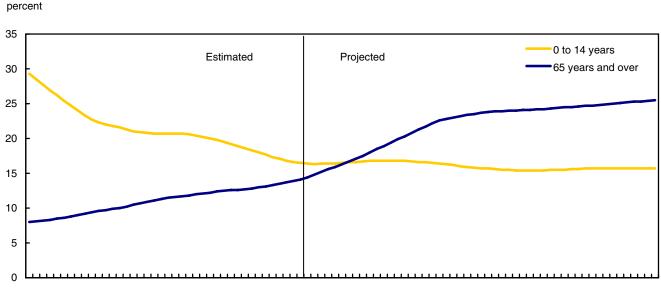

As of July 1, 2010, the working-age population aged 15 to 64 years accounted for 69.4% of the total Canadian population. Although there has been some fluctuation over the years, this proportion is higher than it was in 1971 (62.7%). Despite a larger share compared to several decades ago, this age group has also grown older. Specifically the proportion of 55 to 64 year olds in the working-age population has increased, particularly during the last decade, while the share of 15 to 24 year olds has decreased. As of July 1, 2010, 55 to 64 year olds accounted for 18.0% of Canada's working-age population, up from a range of 12.5% to 13.3% throughout the 1970s to 1990s. In contrast, the youngest group of the working-age population, 15 to 24 year olds, has decreased fairly steadily from 30.1% in 1971 to 19.4% in 2010.

The ratio of 15 to 24 year olds to 55 to 64 year olds was 1.1 on July 1, 2010, meaning that for every person at the age of leaving the labour force, there would be just over one person at the age of labour force entry. In 1971 this ratio was 2.4. As a result of the baby boom cohort leaving the labour force and entering their senior years in the near future, as well as the subsequent smaller cohort, the share of the working-age population in the total population is expected to decrease in the coming years. It is projected that the ratio of the younger working-age population to the older working-age population would be less than one by 2015.

Share of children decreases

While the proportions of the senior population and the population approaching their senior years have been growing over time, the share of the population who are children has been steadily decreasing. As of July 1, 2010, there were 5,616,700 children aged 14 years and under, accounting for 16.5% of the population, down from 16.6% the previous year. In 1971, close to one in three persons in the population were children in this age group (29.3%). It is projected that the proportion of children aged 14 years and under would be surpassed by the proportion of people aged 65 years or over for the first time between 2015 and 2021.

Chart 2.2
Proportion of seniors aged 65 and over and children aged 14 and under, 1971 to 2061, Canada

Provincial and territorial variation

There was a fair amount of consistency among the aging indicators across the country, that is, provinces and territories with a median age that was higher than Canada overall, generally also had a proportion of seniors aged 65 years and over that was above the national figure as well as a lower proportion of children aged 14 years and under. This was the case for all four of the Atlantic provinces, Quebec and British Columbia. In contrast, all three territories, and the western provinces of Alberta and Manitoba had a median age and a proportion of seniors that were lower than the Canadian population overall and a higher proportion of children reflecting younger populations in these provinces and territories. Only in Saskatchewan was there an apparent incoherence with a median age that was lower than the overall Canadian median age and a proportion of children that was higher than the national figure, both pointing to a young population, yet the proportion of seniors in this province was higher than the country as a whole.

At 43.3 years, Newfoundland and Labrador had the oldest population on July 1, 2010 when considering median age, which according to population projections, the nation overall would not reach until 2034. The median ages in Nova Scotia, New Brunswick and Prince Edward Island on July 1, 2010 were 42.8 years, 42.7 years and 42.1 years, respectively, also much higher than the rest of the country. In terms of the proportion of the population aged 65 and over, the ranking is different with Nova Scotia having the oldest population Newfoundland and Labrador, along with Nova Scotia, also had the lowest proportion of children in the country (14.8% each).

With the exception of Prince Edward Island, in the other three Atlantic provinces, the proportion of seniors surpassed the proportion of children, something not projected to happen at the national level for approximately five to ten years. This higher share of seniors compared to children was most pronounced in Nova Scotia. The pattern of aging in the Atlantic provinces is mostly the result of an evolution over the past century during which above average fertility rates were replaced with some of the lowest fertility rates in Canada, as well as, until recently, out-migration of young adults.

Population aging was evident across almost the entire country even in the areas with relatively young

populations. As of July 1, 2010, Canada's youngest population was in Nunavut, where the median age was 24.6 years although it had increased by 0.4 years from the same date in 2009. In Nunavut children aged 14 years and under represented more than three out of ten people in the population (31.5%), close to double the national proportion (16.5%). The territories had the lowest percentage of seniors in Canada, particularly Nunavut where only 3.0% of the population was aged 65 years and over. The Northwest Territories also had a young population with a median age of 31.5 years, a high share of children (21.8%) and a low proportion of seniors (5.4%).

Of the three territories, Yukon had the oldest population, but still well below the national figures. The median age in Yukon was 38.9 years, the share of children in the population was 17.2% and the share of seniors was 8.4%. The territories, particularly Nunavut and the Northwest Territories, are characterized by high fertility and the lowest life expectancy in the country. Among the provinces, Alberta had the youngest population, with a median age of 35.8 years, the lowest proportion of seniors aged 65 years and over (10.6%), and a higher share of children (18.3%) than Canada as a whole (16.5%). The demographic situation in Alberta can be attributed to positive net interprovincial migration from 1995/1996 to 2008/2009 combined with fertility that was higher than the national average.

Only in Manitoba and Saskatchewan, did the median age decrease to 37.7 years (down 0.1 year from July 1, 2009) and 37.5 years (down 0.2 years), respectively. This recent decrease is the combination of several demographic components, including higher numbers of international migrants than in previous years and higher fertility in these provinces, as well as positive net interprovincial migration in Saskatchewan and fewer losses in Manitoba. In addition, both interprovincial and international migrants, who have a lower median age than the overall population, and any births resulting from these migrants, would have a combined effect of lowering the median age. According to the most recent population projections. the population in these provinces are expected to continue to age so it is likely that the slight decreases in median age are annual fluctuations rather than new long term trends.

On July 1, 2010, the proportion of children aged 14 years and under was 18.8% in Manitoba and 18.9% in Saskatchewan, both higher than that of the Canadian population (16.5%). In contrast,

while the proportion of seniors aged 65 years and over in Manitoba (13.8%) was below the national share (14.1%), it was above the national proportion in Saskatchewan (14.6%). The unique demographic situation in Saskatchewan is the result of fertility higher than in the rest of the country, higher life expectancy historically up to the early 1990s, and, until the last several years, relatively high out-migration of young adults.

The two most populous, as well as contiguous, provinces, Quebec and Ontario had differing age structures with Quebec's population older than that of Canada as a whole while the population in Ontario was younger. In Quebec, the median age as of July 1, 2010 was 41.2 years and, in Ontario, it was 39.4 years. Quebec had a proportion of seniors (15.3%) that was above that in Ontario (13.9%) and a lower proportion of children aged 14 years and

under (15.6% and 16.7%, respectively). The younger population in Ontario may be at least partially related to the presence of more immigrants who generally have a younger age structure, as well as any births resulting from these immigrants. Quebec, in contrast, has experienced a higher life expectancy than the national average over the past several decades and, until fairly recently, had lower levels of fertility than the nation overall, factors which contribute to an aging population.

Lower fertility and the highest life expectancy in the country are factors explaining why British Columbia had an older population than for Canada overall. On July 1, 2010, the median age in British Columbia was 40.8 years, the share of seniors aged 65 years and over was 15.0% and the proportion of children aged 14 years and under was 15.1%.

1. Period from July 1 to June 30. **Note(s):** Total net migration numbers are final up to 2006/2007, updated for 2007/2008 and 2008/2009 and preliminary for 2009/2010.

Methodology

For the first time, the Demographic Estimates Section releases simultaneously total estimates and estimates by age and sex. This should become a new practice intended to facilitate the use of our estimates. It may differ for the release of the intercensal estimates.

Please find enclosed postcensal quarterly demographic estimates for July 1, 2010. This document describes the concepts, data sources and methodology used to produce the population estimates. Population estimates are produced to measure the population counts according to various characteristics and geographies between two censuses. Population estimates are the official figures used for the count of the population at the national, provincial and territorial levels.

Population Estimates

Estimates of the total population

Types of estimates

Population estimates can be either intercensal or postcensal. Intercensal estimates are produced using counts from two consecutive censuses adjusted for census net undercoverage (CNU)¹ (including adjustment for incompletely enumerated Indian reserves) and postcensal estimates. The production of intercensal estimates involves updating the postcensal estimates using the counts from a new census adjusted for CNU¹.

Postcensal estimates are produced using data from the most recent census adjusted for CNU¹ and the components of population growth. In terms of timeliness, postcensal estimates are more up-to-date than data from the most recent census adjusted for CNU¹, but as they get farther from the date of that census, they become more variable.

Levels of estimates

Updating population estimates between censuses entails the use of data from administrative files or surveys. The quality of population estimates therefore depends on the availability of a number of administrative data files that are provided to Statistics Canada by Canadian and foreign government departments. Since some components are not available until several months after the reference date, three kinds of postcensal estimates are produced preliminary postcensal (PP), updated postcensal (PR) and final postcensal (PD). The time lag between the reference date and the release date is three to four months for preliminary estimates and two to three years for final estimates. Though it requires more vigilance on the part of users, the production of three successive series of postcensal estimates is the strategy that best satisfies the need for both timeliness and accuracy of the estimates. All tables in the CD-ROM indicate the level of the estimates they contain.

Calculation of postcensal population estimates

Population estimates – preliminary, updated and final – are produced by the component method. This method consists in taking the population figures from the most recent census, adjusted for census net undercoverage (CNU¹) (census undercoverage minus census overcoverage), and adding or subtracting the number of births, deaths, and components of international and interprovincial migration.

^{1.} In this case, the adjustment for the census net undercoverage also includes the incompletely enumerated Indian reserves.

A. Provincial / territorial estimates of total population

Population estimates are produced for the provinces and territories first; then they are summed to obtain an estimate of the population of Canada.

The component-method formula for estimating total provincial / territorial populations is as follows:

$$P_{(t+i)} = P_{(t)} + B_{(t,t+i)} - D_{(t,t+i)} + I_{(t,t+i)} - [E_{(t,t+i)} + \Delta TE_{(t,t+i)}] + RE_{(t,t+i)} + \Delta NPR_{(t,t+i)} + \Delta N_{(t,t+i)} - Resid_{(t,t+i)}$$
where, for each province and territory:

(t,t+i) = interval between times t and t+i;

 $P_{(t+i)}$ = estimate of the population at time t+i;

P_(t) = base population at time t (census adjusted for (CNU¹), or most recent estimate);

B = number of births;

D = number of deaths;

I = number of immigrants;

E = number of emigrants;

 ΔTE = net temporary emigration;

RE = number of returning emigrants;

 Δ NPR = net non-permanent residents;

 ΔN = net interprovincial migration;

Resid = residual deviation (for intercensal estimates).

B. Provincial / territorial estimates by age and sex

Postcensal population estimates by age and sex are produced applying the component method to each age-sex cohort in the base population.

At age 0:

$$P_{(t+1)}^{0} = B_{(t,t+1)} - D_{(t,t+1)}^{-1} + I_{(t,t+1)}^{-1} - \left[E_{(t,t+1)}^{-1} + \Delta T E_{(t,t+1)}^{-1}\right] + R E_{(t,t+1)}^{-1} + \Delta N P R_{(t,t+1)}^{-1} + \Delta N_{(t,t+1)}^{-1} - Re \, sid_{(t,t+1)}^{-1} + Re \, sid_{(t,t+1)$$

From 1 to 99 years:

$$P_{(t+1)}^{a+1} = P_{(t)}^{a} - D_{(t,t+1)}^{a} + I_{(t,t+1)}^{a} - \left[E_{(t,t+1)}^{a} + \Delta T E_{(t,t+1)}^{a} \right] + R E_{(t,t+1)}^{a} + \Delta N P R_{(t,t+1)}^{a} + \Delta N_{(t,t+1)}^{a} - Re \, sid_{(t,t+1)}^{a}$$

For 100 years and over:

$$P_{(t+1)}^{100+} = P_{(t)}^{99+} - D_{(t,t+1)}^{99+} + I_{(t,t+1)}^{99+} - \left[E_{(t,t+1)}^{99+} + \Delta T E_{(t,t+1)}^{99+} \right] + R E_{(t,t+1)}^{99+} + \Delta N P R_{(t,t+1)}^{99+} + \Delta N_{(t,t+1)}^{99+} - Re \, sid_{(t,t+1)}^{99+}$$

where, for each province and territory;

```
(t,t+1) = interval between times t and t+1;
```

a = age;

 $P_{(t+1)}$ = estimate of the population at time t+1;

 $P_{(t)}$ = base population at time t (census adjusted for CNU¹, or most recent estimate);

B = number of births;
D = number of deaths;
I = number of immigrants;
E = number of emigrants;
ΔTE = net temporary emigration;
RE = number of returning emigrants;

 Δ NPR = net non-permanent residents;

 ΔN = net interprovincial migration;

Resid = residual deviation (for intercensal estimates).

C. Levels of estimates

The difference between preliminary² and final postcensal population estimates lies in the timeliness of the components. When all the components are preliminary, the estimate is described as preliminary postcensal (PP). When they are all final, the estimate is referred to as final postcensal (PD). Any other combination of levels is referred to as updated postcensal (PR).

Base population and components of population growth

A. Base population

The base populations are derived from the quinquennial censuses between 1971 and 2006. The population universe of the 2006³ Census includes the following groups:

- Canadian citizens (by birth or by naturalization) and landed immigrants with a usual place of residence in Canada;
- Canadian citizens (by birth or by naturalization) and landed immigrants who are abroad, either on a military base or attached to a diplomatic mission;
- Canadian citizens (by birth or by naturalization) and landed immigrants at sea or in port aboard merchant vessels under Canadian registry;
- persons with a usual place of residence in Canada who are claiming refugee status and members of their families living with them;
- persons with a usual place of residence in Canada who hold Study Permits and members of their families living with them;
- persons with a usual place of residence in Canada who hold Work Permits and members of their families living with them.

^{2.} Unless otherwise noted, the term preliminary include both preliminary and updated estimates.

^{3.} From 1991 to 2001 Census, "persons with a usual place of residence in Canada who hold Minister's permits (including extensions) and members of their families living with them" were included in the census universe

For census purposes, the last three groups in this list are referred to as non-permanent residents (NPR).

Foreign residents have not been enumerated since 1991. Foreign residents are persons who belong to the following groups:

- Government representatives of another country attached to the embassy, high commission or other diplomatic body of that country in Canada, and members of their families living with them;
- members of the Armed Forces of another country who are stationed in Canada, and members of their families living with them;
- residents of another country visiting Canada temporarily (for example, a foreign visitor on vacation or on business, with or without a visitor's permit).

These populations are adjusted as follows:

- Adjustment of the population for census net undercoverage (CNU);
- addition of independent estimates for incompletely enumerated Indian reserves in 1991, 1996, 2001 and 2006;
- adjustment for early enumeration in 1991 and 1996 in parts of northern Quebec, Newfoundland and Labrador, the Yukon and the Northwest Territories;
- addition of estimates of NPRs in 1971, 1976, 1981 and 1986. Since 1991, NPRs are included in the census universe:
- estimation of the July 1 base population by addition or subtraction of the components of growth between Census Day and June 30.

Adjustment for census net undercoverage (CNU)

The adjustment for CNU is important. CNU is the difference between the number of persons who should have been enumerated but were missed (undercoverage) and the number of persons who were enumerated but should not have been or who were counted more than once (overcoverage).

Coverage studies provide undercoverage estimates for the 1991, 1996, 2001 and 2006 Censuses at the provincial and territorial levels, and for the 1971, 1976, 1981 and 1986 Censuses at the provincial level only. Estimates of overcoverage at the provincial and territorial levels are available only for the last four censuses (1991, 1996, 2001 and 2006). Overcoverage for previous censuses was estimated by assuming that the overcoverage-to-undercoverage ratio for each census between 1971 and 1986 was the same as in 1991. The CNU for the Yukon and the Northwest Territories prior to 1991 was estimated by assuming that the ratio between the CNU for each territory and the 10 provinces for each census between 1971 and 1986 was the same as in 1991.

For consistency, 1991 Census undercoverage and overcoverage were revised in 1998 to take into account the methodological improvements made in the 1996 Census coverage studies. This revision altered the CNU in all censuses between 1971 and 1986. Similarly, 1996 Census undercoverage and overcoverage were revised in 2003.

Various methods were used to produce the estimates of CNU by age and sex for 1991, 1996, 2001 and 2006. First, the national estimates of CNU based on the coverage studies by age and sex were smoothed. Then an Empirical Bayes regression model was used to generate provincial and territorial estimates of CNU by broad age groups, and a synthetic model produced estimates by single year of age. Lastly, two-way raking⁴ was used to ensure that the CNU estimates were consistent with the provincial and territorial CNU totals and the national estimates by age and sex.

^{4.} Two-way raking is also referred to as the "Deming method", the "method of iterative proportions", and calibration (see Shryock, Siegel et al., 1976: 547-549).

For the 1971 to 1986 period, the CNU estimates by age and sex were simply prorated to the revised CNU estimates for the total population.

B. Births and deaths

Numbers of births and deaths are derived directly from the vital statistics database of Statistics Canada's Health Statistics Division. Although Statistics Canada manages the National system of vital statistics, the central vital statistics registries of the provinces and territories are responsible for collecting and processing the information from those administrative files. Under provincial / territorial vital statistics statutes (or similar legislation), all live births and all deaths must be registered, and all provinces and territories provide the information to Statistics Canada.

The vital statistics universe closely parallels the census universe. Both universes include births and deaths of all Canadians, immigrants and non-permanent residents (NPR) and exclude foreign residents.

Vital statistics by province or territory of residence are used to produce our final estimates of births and deaths.

When there are no vital statistics, the number of births is estimated using fertility rates by mother's age. The number of deaths is estimated using mortality rates by age and sex. These methods are used to calculate preliminary² estimates.

Special treatment for preliminary² estimates for Quebecand British Columbia

Quebec and British Columbia provide their most recent estimates of births and deaths. The figures are used to produce preliminary² estimates. For the final estimates, the two provinces' births and deaths are derived from the vital statistics compiled by Health Statistics Division.

If current vital statistics are unavailable for sex, the number of births by sex is derived by applying the latest birth distribution from vital statistics to the preliminary birth estimates.

If current vital statistics are unavailable by age and sex, the number of deaths by age and sex is derived by applying the mortality distribution from the last two years provided by vital statistics to the preliminary death estimates.

Levels of estimates

For information on the differences between preliminary² and final estimates, see sections **B. Births and Deaths**, above.

C. Immigration

Like the numbers of births and deaths, Canadian immigration statistics must be kept by law. In Canada, immigration is regulated by the *Immigration and Refugee Protection Act* (IRPA) of 2002. This statute superseded the *Immigration Act*, which was passed in 1976 and amended more than 30 times in the years thereafter. *Citizenship and ImmigrationCanada* (CIC) collects and processes immigrants' administrative files. It then provides Statistics Canada with information from *Field Operational Support System* (FOSS) files. The information is used to estimate the number and characteristics of people granted permanent resident status by the federal government on a given date. For Demography Division, the terms immigrant and permanent resident are equivalent.

An immigrant is a person who is not a Canadian citizen by birth, but has been granted the right to live in Canada permanently by Canadian immigration authorities. The number of immigrants does not include persons born abroad to Canadian parents who are only temporarily outside the country.

Immigrants are usually counted on or after the date on which they are granted permanent resident status or the right to live in Canada.

The number of immigrants by age and sex is derived from the Field Operational Support System (FOSS).

Levels of estimates

The difference between preliminary² and final postcensal estimates lies in the timeliness of the source used to estimate this component. Since the FOSS file is continually being updated, new calculations are carried out each year to update the immigration estimates. Immigration estimates are preliminary the first year and updated the following year. They become final two years after the reference year.

D. Net non-permanent residents

Like the numbers of births and deaths, Canadian immigration statistics must be kept by law. In Canada, the non-permanent residents (NPR) are regulated by the *Immigration and Refugee Protection Act* (IRPA) of 2002. This statute superseded the *Immigration Act*, which was passed in 1976 and amended more than 30 times in the years thereafter. *Citizenship and ImmigrationCanada* (CIC) collects and processes the administrative files of immigrants and NPRs in Canada. It then provides Statistics Canada with information from *Field Operational Support System* (FOSS) files. The information is used to estimate the number and characteristics of people granted non-permanent resident status by the federal government.

Non-permanent residents (NPR) are persons who are lawfully in Canada on a temporary basis under the authority of a temporary resident permit, along with members of their family living with them. Non-permanent residents (NPR) include foreign workers, foreign students, the humanitarian population and other temporary residents. The humanitarian population includes refugee claimants and temporary residents who are allowed to remain in Canada on humanitarian grounds and are not categorized as either foreign workers or foreign students. For Demography Division, the terms non-permanent resident and temporary resident are equivalent.

Estimates of the number of NPR are based on population estimates. The number of people in CIC's system is estimated on a specific date in each year of observation. First, the end-of-period population is estimated, and then the start-of-period population is subtracted from that estimate. That yields the net number of NPR.

Anyone who received non-permanent resident status prior to the observation date is counted. For refugee claimants, the date of their application is used. Permit holders and refugee claimants are excluded from the population if their permit has expired, if they receive permanent resident status, or if they are deported. In addition, refugee claimants are excluded if their file has been inactive for two years.

Since the FOSS file is continually being updated, the figures are recalculated for each new release period to update the estimates of the net number of NPR in Canada. Non-permanent residents (NPR) estimates are preliminary the first year and updated the following year. They are finalized two to three years after the reference year, when all other components are also final.

The net number of non-permanent residents by age and sex is derived from the *Field Operational Support System* (FOSS).

Levels of estimates

The difference between preliminary² and final estimates lies in the timeliness of the source used to estimate this component. Since the FOSS file is continually being updated, the figures are recalculated for each new release period to update the estimates of the net number of NPRs. Non-permanent resident (NPR) estimates are preliminary the first year and updated the following year. They become final two to three years after the reference year.

E. Emigration

The number of emigrants is estimated using data from the Office of Immigration Statistics, U.S. Department of Homeland Security, data collected by the Canada Child Tax Benefit (CCTB) program, and data from the T1 Family File (T1FF)⁵. The first source is used to estimate emigration to the United States. CCTB data are used to estimate emigration to other countries. The estimates of the number of child emigrants have to be adjusted because the CCTB is not universal and does not provide direct information on the number of adult emigrants. As a result, four adjustment factors are used to take into account:

^{5.} The T1 family file (T1FF) is derived from the Canada Revenue Agency (CRA) T1 file by Small Area and Administrative Data Division of Statistics Canada.

- Incomplete coverage due to a delay in the receipt and processing of the files of children eligible for the CCTB.
 Since it seems to take four years after the reference period for CCTB administrative files to become complete, the adjustment is made if the estimates are finalized after two years. The factor is derived from the two-year ratios of emigrant children based on two versions of the CCTB files;
- the program's partial coverage, that is, people who do not apply for the CCTB or are not eligible. This factor is
 obtained by comparing the estimated number of children in the population with the number of children in CCTB
 files;
- the differential propensity to emigrate between children who are *eligible* for the CCTB and children who are not.
 This factor is obtained by comparing the emigration rates of CCTB-eligible children with the rates for all children (aged 0-17). This factor is calculated for each province and territory and is based on the last three available years of T1FF⁵;
- the differential propensity to emigrate between adults and children. This factor generates the emigration rate for
 the population aged 18 and over. It is obtained by (1) calculating the average ratio over three years of the adult
 and child emigration rates based on T1FF⁵ data, (2) calculating the average ratio over three years of the adult
 and child emigration rates based on data from the Office of Immigration Statistics, U.S. Department of Homeland
 Security, and (3) taking the average of the two rates. This factor is calculated for Canada only.

The adult emigration rate is applied to the adult population to generate the number of adult emigrants, which is then added to the number of child emigrants to produce the number of emigrants for the entire population.

Emigration is disaggregated by province and territory based on the number of child emigrants adjusted for coverage and differential emigration.

Estimates of the number of emigrants by age and sex are obtained by disaggregating the broad age groups in the T1FF⁵ into five-year age groups based on data from the Office of *Immigration Statistics*, *U.S. Department of Homeland Security*, and disaggregating those estimates into single years of age using Sprague coefficients. The same distribution is used for all provinces and territories.

Levels of estimates

The difference between preliminary² and final estimates lies in the timeliness of the sources used to estimate this component. The same estimation method is used.

F. Net temporary emigration

Some people leave Canada to live temporarily in another country; others who were temporarily outside Canada return. The net result of those departures and returns is the component known as "net temporary emigration". Estimates of the number of departures are derived from the *Reverse Record Check* (RRC), the most important census coverage study. The RRC provides an estimate of the number of people who left Canada temporarily during an intercensal period and are still out of the country at the end of the period. Estimates of the number of returns are based on two sources: the Census and Demography Division's estimates of returning emigrants. The census provides the number of people who were outside Canada at the time of the previous census and returned during the intercensal period. That number includes all returning emigrants. Then Demography Division's estimate of the returning emigrants' component is subtracted to produce the number of returning temporary emigrants. The estimated numbers of departures (RRC) and returns (Census and Demography Division) yield an estimate of net temporary emigration.

That estimate is for the whole intercensal period; it is disaggregated into estimates for each of the five years in the period and then into monthly estimates using a seasonal adjustment that is an average between zero seasonality and the seasonality of emigration.

Net temporary emigration is calculated first for the national level. It is then disaggregated by province or group of provinces based on the RRC estimates of temporary emigration. For the Atlantic provinces and the territories, the

estimate for the group is disaggregated on the basis of each province / territory's proportion of the group's total population.

Net temporary emigration can be estimated only for the intercensal period preceding the most recent census. Net temporary emigration in the current period is assumed to be the same as in the previous period for each province and territory.

The emigration age and sex distribution is applied to obtain the age and sex structure of the net temporary emigration.

Levels of estimates

The difference between preliminary² and final estimates lies in the timeliness of the emigration estimate used to calculate the seasonal adjustment for the net temporary emigration. The same estimation method is used.

G. Returning emigrants

A returning emigrant is a person who returns to Canada after having been classified as an emigrant. In a manner similar to the procedure used to calculate the number of emigrants, data from the *Canada Child Tax Benefit* (CCTB) file and the *Canada Revenue Agency's* (CRA) 's T1FF⁵ are used to estimate the number of returning emigrants. Adjustment factors are applied to compensate for the fact that the CCTB program is not universal, and an adult/child ratio is used to estimate the number of adult returning emigrants. As a result, three adjustment factors are used to take into account:

- The program's partial coverage, that is, people who do not apply for the CCTB or are not eligible. This factor is
 obtained by comparing the estimated number of children in the population with the number of children in CCTB
 files;
- the differential propensity to emigrate between children who are eligible for the CCTB and children who are not.
 This factor is obtained by comparing the emigration rates of CCTB-eligible children with the rates for all children (aged 0-17). This factor is calculated for each province and territory and is based on the last three available years of T1FFs⁵;
- the adult / child ratio, which is based on the census used in estimating the base population.

The age and sex distribution of returning emigrants is based on Census of Canada data. Characteristics of returning emigrants are derived from census mobility data 1 year ago, after excluding non-permanent residents and immigrants. From 2006/2007, we are using distribution by age and sex derived from 2006 Census.

Levels of estimates

The difference between preliminary² and final estimates lies in the timeliness of the sources used to estimate this component. The same estimation method is used.

H. Interprovincial migration

Interprovincial migration represents movements from one province or territory to another, involving a change in usual place of residence. As is the case for emigration, there is no provision for recording interprovincial migration in Canada. Consequently, such movements have to be estimated using data from the Canada Child Tax Benefit (CCTB) of Canada Revenue Agency (CRA) and the T1FF⁵.

Final estimates of interprovincial migration are obtained by comparing addresses indicated on personal income tax returns over two consecutive tax years. However, the migration status of taxfilers' dependants has to be imputed. An adjustment is also required to take into account migrants who do not file income tax returns. From 2001/2002 to 2005/2006, the adjustment was slightly modified (for further information, see *Wilkinson, 2004*). From 2006/2007, this adjustment has slightly modified (Cyr, 2008 – Internal document).

Since income tax returns are not available at the time preliminary estimates are produced, the estimation of preliminary² interprovincial migration is based on CCTB administrative files, which provide counts of child migrants (aged 0-17) *receiving benefits* under the program. The estimates have to be adjusted later for children who are not receiving the CCTB. Finally, the number of adult migrants is calculated using the number of child migrants and factors derived from the T1FF⁵. As a result, three adjustment factors are used to take into account:

- The program's partial coverage, that is, people who do not apply for the CCTB or are not receiving *benefits*. This factor is obtained by comparing the estimated number of children in the population with the number of children in CCTB files:
- the differential propensity to migrate between children who are receiving the CCTB and children who are not.
 This factor is obtained by comparing the out-migration rates of children receiving the CCTB with the rates for all children (aged 0-17). This factor is calculated for each province and territory and is based on the last available year of T1FFs⁵;
- the differential propensity to migrate between adults and children. This factor generates the out-migration rate of the population aged 18 and over for each province / territory of origin and destination. It is obtained by calculating the ratio of the central migration rate for adults to the rate for children. It is estimated using data from the last three available years of T1FFs⁵.

The adult migration rate is then applied to the estimated adult population. The number of adult migrants is then added to the number of child migrants to produce the number of interprovincial migrants for the entire population.

Interprovincial migration by age and sex is derived from T1FF⁵ data and counts from the last available census (1-year mobility variable). From 2006/2007, the 2006 Census age and sex distribution is used.

Levels of estimates

For information on the differences between preliminary² and final estimates of total interprovincial migration, see section **H. Interprovincial migration** above.

Intercensal population estimates

Intercensal estimates – population estimates for reference dates between two censuses – are produced following each census. They reconcile previous postcensal estimates with the new census counts.

There are two main steps in the production of intercensal estimates:

- · Calculation of the error of closure;
- · linear distribution of the error of closure.

Error of closure is defined as the difference between the postcensal population estimates on Census Day and the population enumerated in that census (after adjustment for census net undercoverage (CNU¹)).

The error of closure is spread uniformly over the intercensal period of days within each month.

Intercensal estimates by age and sex are adjusted in the same way, i.e., by distributing the error of closure uniformly across the age-sex cohorts.

Quality of demographic data

The estimates contain certain inaccuracies stemming from two types of errors:

- · Errors in the census data:
- imperfections in other data sources and the method used to estimate the components.

Census Data

A. Coverage, response and imputation errors

The errors attributable to census data can be divided into two groups: Response and processing errors, and coverage errors. The first group implies non-response error, misinterpretation by respondents, incorrect coding and non-response imputation. Errors in the second group primarily result from undercoverage and, to a lesser extent, overcoverage. It should be noted that both types of errors are intrinsic to any survey data.

The coverage errors occur when dwellings and/or individuals are missed, incorrectly included or counted more than once. Following each census, Statistics Canada undertakes coverage studies to measure these errors. The main studies are the *Reverse Record Check Survey* (RRC) and the *Census Overcoverage Study* (COS). Based on these studies, estimates of *census net undercoverage* (CNU) (which is equal to the difference between undercoverage and overcoverage) are produced. Demography Division adjusts the population enumerated in the census by province and territory using these estimates.

During the process of developing base populations, an attempt was made to correct only coverage errors in the population base. However, the correction based on the results of the coverage studies and on modeling of overcoverage for provinces and territories by age and sex prior to 1991, was also subject to sampling, collection, response and processing errors and uncertainty in the assumptions underlying the models. With respect to the coverage studies, statistical analysis concluded that the adjustment, although not without errors itself, improved the quality of census data (Royce, 1993). They were deemed to be consistent over time and across geographical areas, and to provide logical results. Users should also be aware that when calculating *census net undercoverage* (CNU) rates for small areas, it is likely that the underlying assumptions may be violated. If this is true, the resulting CNU rate would be misleading. Errors associated with these assumptions are, however, very difficult to quantify.

Nevertheless, the corrections to the census data due to CNU improved, in general, the quality of the estimates by compensating for the differential undercoverage by age, sex and by province/territory across censuses.

Text table 1
Estimated census net undercoverage, Canada, provinces and territories, 2001 and 2006 Censuses

| Geography | Census population | Census net undercoverage | Incompletely enumerated Indian reserves C | Adjusted population D=A+B+C | Rate (B+C)/D*100 |
|---------------------------|-------------------|--------------------------|--|-----------------------------|---------------------|
| | | | | | |
| 2001 1 | | | | | |

| Northwest Territories | 37,360 | 3,295 | 0 | 40,655 | 8.1 |
| Nunavut | 26,745 | 1,256 | 0 | 28,001 | 4.49 |
| 2006 1 | | | | | |
| Canada | 31,612,897 | 868,658 | 40,115 | 32,521,670 | 2.79 |
| Newfoundland and Labrador | 505,469 | 5,046 | 0 | 510,515 | 0.99 |
| Prince Edward Island | 135,851 | 1,903 | 0 | 137,754 | 1.38 |
| Nova Scotia | 913,462 | 24,558 | 0 | 938,020 | 2.62 |
| New Brunswick | 729,997 | 16,059 | 0 | 746,056 | 2.15 |
| Quebec | 7,546,131 | 60,751 | 16,600 | 7,623,482 | 1.01 |
| Ontario | 12,160,282 | 465,824 | 15,391 | 12,641,497 | 3.81 |
| Manitoba | 1,148,401 | 34,330 | 0 | 1,182,731 | 2.9 |
| Saskatchewan | 968,157 | 22,594 | 739 | 991,490 | 2.35 |
| Alberta | 3,290,350 | 111,353 | 7,272 | 3,408,975 | 3.48 |
| British Columbia | 4,113,487 | 121,551 | 113 | 4,235,151 | 2.87 |
| Yukon | 30,372 | 1,805 | 0 | 32,177 | 5.61 |
| Northwest Territories | 41,464 | 1,620 | 0 | 43,084 | 3.76 |
| Nunavut | 29,474 | 1,264 | 0 | 30,738 | 4.11 |

^{1.} The levels and rates are based on the Reverse Record Check (RRC) and the Overcoverage Study and include non-permanent residents.

The adjustment also incorporates the results of a study on the estimates of the number of people living on incompletely enumerated Indian reserves to complete the corrections for coverage errors in the census. The results of the coverage studies contain mainly sampling errors.

These adjustments have a direct impact on:

- The error of closure and its distribution by age and sex within a province or a territory as well as by province/territory as the CNU¹ and its distribution vary from one census to another;
- within-cohort consistency of population estimates. If for example, the male cohort in age group 0-4 in 1981 was
 tracked up to the 2001 Census (unadjusted for CNU¹) the age group 20-24 would be noticeably smaller
 in 2001 than the age group 15-19 in 1996. Since Canada receives many immigrants within these age
 groups, the opposite would be expected. However, only after adjustment for CNU¹, the cohort size increases
 from 1996 to 2001.

Text table 2
Estimated census net undercoverage by age and sex, 2006 Census, Canada

| | Census population | Census net undercoverage | Incompletely enumerated Indian reserves | Demographic adjustment | Adjusted population | Rate |
|----------|----------------------|-----------------------------|---|------------------------|---------------------|-------|
| All ages | 31,612,897 | 868,658 | 40,115 | 0 | 32,521,670 | 2.79 |
| 0 to 4 | 1,690,539 | 34,522 | 4,360 | 0 | 1,729,421 | 2.25 |
| 5 to 9 | 1,809,373 | 12,450 | 4,251 | 23 | 1,826,097 | 0.92 |
| 10 to 14 | 2,079,926 | 14,500 | 4,528 | 15 | 2,098,969 | 0.91 |
| 15 to 19 | 2,140,493 | 64,484 | 3,931 | 132 | 2,209,040 | 3.1 |
| 20 to 24 | 2,080,384 | 165,947 | 3,051 | 4 | 2,249,386 | 7.51 |
| 25 to 29 | 1,985,580 | 189,589 | 2,759 | 33 | 2.177.961 | 8.83 |
| 30 to 34 | 2,020,228 | 144,323 | 2,763 | 33 3 | 2,167,317 | 6.79 |
| 35 to 39 | 2,208,273 | 111,093 | 2,807 | 701 | 2,322,874 | 4.93 |
| 40 to 44 | 2,610,458 | 108,612 | 2,734 | 8 | 2,721,812 | 4.09 |

| 50 to 54 | 2,357,304 | 12,738 | 1,842 | 5 | 2,371,889 | 0.61 |
| 55 to 59 | 2,084,621 | -2,518 | 1,499 | 62 | 2,083,664 | -0.05 |
| 60 to 64 | 1,589,868 | -3,245 | 1,177 | 17 | 1,587,817 | -0.13 |
| 65 to 69 | 1,234,577 | -7,294 | 855 | 127 | 1,228,265 | -0.51 |
| 70 to 74 | 1,053,786 | -8,716 | 588 | 18 | 1,045,676 | -0.78 |
| 75 to 79 | 879,578 | -4,551 | 354 | 24 | 875,405 | -0.48 |
| 80 to 84 | 646,703 | -4,694 | 199 | 16 | 642,224 | -0.7 |
| 85 to 89 | 342,684 | -1,211 | 70 | 65 | 341,608 | -0.31 |
| 90 to 94 | 139,104 | 57 | 21 | 24 | 139,206 | 0.07 |
| 95 to 99 | 34,188 | 24 | 2 | -1,455 | 32,759 | -4.36 |
| 100+ | 4,632 | 4 | 2 0 | 0 | 4,636 | 0.09 |

For further information regarding the main coverage studies, please see the following document on Statistics Canada's web site: 1996, 2001 and 2006 Census Technical Report on Coverage.

Components

Errors due to estimation methodologies and data sources other than the census can also be significant.

A. Births and deaths

Since the law requires the recording of vital statistics, the final estimates for births and deaths data meet very high standards. Nevertheless, since preliminary estimates are derived, they can be slightly different from final estimates.

B. Immigration and non-permanent residents

With respect to immigrants and NPRs, Citizenship and Immigration Canada administers special data files on both of these components. Since immigration is controlled by law, data on immigrants and non-permanent residents (NPRs) are compiled upon arrival in Canada. These data represent only "legal" immigration and exclude illegal immigrants. Thus, for the "legal" part of international movement into Canada, the data are considered to be of high quality. However, some biases such as the difference between the stated province of intended residence at the time of arrival and the actual province of residence, may persist. Finally, since information provided by the *Visitor Data System* (VDS) from *Citizenship and Immigration Canada* (CIC) is not complete (age and sex of dependents, province of residence for certain groups of permit holders), estimates of NPRs are more prone to error than data on immigrants.

C. Emigration, returning emigration and net temporary emigration

Of all the demographic components that are used in the population estimates program, these components are the most difficult to estimate with precision. Canada does not have a complete border registration system. While immigration and non-permanents residents (NPRs) are well documented by the federal government, Statistics Canada has always used techniques of indirect estimation in the estimation of persons leaving the country. For this

reason, available statistics regarding these three components have historically been of a lower quality than other components.

Estimates of the number of emigrants and returning emigrants are both derived using *Canada Child Tax Benefit* (CCTB) data provided by *Canada Revenue Agency* (CRA). Data are adjusted to take into account the incomplete coverage of the program and to derive the emigration and returning emigration of adults.

These adjustments and the delay in obtaining the data are the two main sources of errors. As current information on the number of persons living temporarily abroad does not exist, estimates are based on the *Reverse Record Check* (RRC) and the census. Estimates for the intercensal period, distributed equally among the five years, are maintained constant for the postcensal period. Moreover, assumptions were made to allow for the distribution of annual estimates to a quarterly level. Any geographical or quarterly variation may introduce error in the estimation of these components.

D. Interprovincial migration

Since July 1993, preliminary² interprovincial migration estimates have been based on *Canada Child Tax Benefit* (CCTB) files. Under this program, only 76% of children aged 0-17 at the Canada level were entitled to benefits on July 1, 2001. Consequently, preliminary CCTB based estimates are subject to larger error than final estimates derived from *Canada Revenue Agency* (CRA) tax files.

E. Level of detail of components

As a more detailed breakdown of the data introduces a greater risk of inaccuracy into the estimates, the possibility of error in the components is augmented by the method used to distribute the estimates by age and sex. It seems that, in general, the initial errors should be minimal where the distribution of annual estimates of births, deaths and immigrants is concerned, and more significant with regard to the distribution of other components (non-permanent residents, emigrants, returning emigrants, net temporary emigrants and interprovincial migrants). Finally, the size of error due to the age and /sex distribution may vary by period and errors in some components may have a greater impact on a given age group or sex.

Quality assessment

In order to assess the quality of our estimates, two evaluation measures are used: Precocity errors and errors of closure.

A. Precocity error

Precocity error allows for useful comparisons between components, as well as between provinces and territories or geographical areas of different population size. Note that when compared to the total population for an area, the differences between preliminary and final estimates of the components are quite small. There are, however, differences in the amount of impact on the population estimates between components and between provinces and territories.

The quality of preliminary estimates of components is analyzed using precocity errors. Precocity error is defined as the difference between preliminary and final estimate of a particular component in terms of its relative proportion of the total population for the relevant geographical area. It can be calculated for both population and component estimates.

Generally speaking, net interprovincial migration yields the greatest precocity errors. This is likely the result of the use of different data sources for preliminary and final estimates. In most years and for most provinces/territories, births, deaths and immigration estimates yielded the smallest precocity errors. For immigration estimates, this reflects the completeness of the data source and the availability of data for the more timely preliminary estimates. In the case of births and deaths, small precocity errors support the use of short-term projections for preliminary estimates.

According to the analysis of the most recent precocity errors and assuming that the quality of the basic data remains constant, the present postcensal estimates should have an acceptable degree of reliability.

Precocity errors by age and sex are not currently available.

Text table 3

Most up-to-date annual precocity errors for components, Canada, provinces and territories

| Year/ Component | Canada | N.L. | P.E.I. | N.S. | N.B. | Que. | Ont. | Man. | Sask. | Alta. | B.C. | Y.T. | N.W.T. | Nvt |

B. Error of closure

The error of closure measures the exactness level of the final postcensal estimates. It can be defined as the difference between the enumerated population of the most recent census (after adjustments for census net undercoverage (CNU¹)) and the most current postcensal population estimates as of Census Day.

The error of closure comes from two sources: The relative differences in the amount of CNU¹ and errors in the components of demographic growth over the intercensal period. This can be calculated for total population estimates and for age, sex and marital status. With each 5-year intercensal period, the error of closure can only be calculated with the release of census data and estimates of CNU¹.

The error of closure can be calculated for total population estimates and for age and sex.

Text table 4
Error of closure of the estimates of population by age and sex, 2006, Canada

| | Both sexe | es . | Male | | Female | | |
|----------|-----------|------------|---------|------------|---------|------------|--|
| | Number | Percentage | Number | Percentage | Number | Percentage | |
| All ages | 105,352 | 0.32 | 42,484 | 0.26 | 62,868 | 0.38 | |
| 0 to 4 | -15,932 | -0.92 | -12,894 | -1.45 | -3,038 | -0.36 | |
| 5 to 9 | 24,158 | 1.32 | 9,867 | 1.05 | 14,291 | 1.61 | |
| 10 to 14 | -5,454 | -0.26 | 728 | 0.07 | -6,182 | -0.6 | |
| 15 to 19 | -38,604 | -1.75 | -23,856 | -2.1 | -14,748 | -1.37 | |
| 20 to 24 | 13,156 | 0.58 | 5,146 | 0.45 | 8,010 | 0.73 | |
| 25 to 29 | 57,062 | 2.62 | 33,098 | 3.02 | 23,964 | 2.21 | |
| 30 to 34 | 61,700 | 2.85 | 34,256 | 3.14 | 27,444 | 2.55 | |
| 35 to 39 | 36,859 | 1.59 | 14,501 | 1.24 | 22,358 | 1.94 | |
| 40 to 44 | -11,133 | -0.41 | -9,086 | -0.66 | -2,047 | -0.15 | |
| 45 to 49 | 6,343 | 0.24 | 867 | 0.06 | 5,476 | 0.41 | |
| 50 to 54 | -10,525 | -0.44 | -6,764 | -0.58 | -3,761 | -0.31 | |
| 55 to 59 | -5,582 | -0.27 | -3,239 | -0.31 | -2,343 | -0.22 | |
| 60 to 64 | -9,923 | -0.62 | -4,908 | -0.63 | -5,015 | -0.62 | |
| 65 to 69 | -3,073 | -0.25 | -1,289 | -0.22 | -1,784 | -0.28 | |
| 70 to 74 | 1,322 | 0.13 | 2,504 | 0.51 | -1,182 | -0.21 | |
| 75 to 79 | 4,651 | 0.53 | 2,735 | 0.71 | 1,916 | 0.39 | |
| 80 to 84 | -2,471 | -0.38 | -712 | -0.28 | -1,759 | -0.45 | |
| 85 to 89 | 2,485 | 0.73 | 1,325 | 1.16 | 1,160 | 0.51 | |
| 90 to 94 | 296 | 0.21 | 197 | 0.51 | 99 | 0.1 | |
| 95 to 99 | 16 | 0.05 | 9 | 0.13 | 7 | 0.03 | |
| 100+ | 1 | 0.02 | -1 | -0.12 | 2 | 0.05 | |

By dividing the error of closure by the census population adjusted for CNU1, the differences are relatively small at the national level (0.16% for 2001 and 0.32% for 2006). At the provincial and territorial level, differences are understandably larger, since the estimates are also affected by errors in estimating interprovincial migration. Nevertheless, the provincial/territorial final postcensal estimates generally fall within 1% of the adjusted census population, except for the territories that falls within closer adjustments.

Text table 5
Error of closure of the estimates of population, Canada, provinces and territories, 2001 and 2006

| <u></u> | 2001 | | 2006 | |
|---------------------------|--------|-----------------|---------|-----------------|
| | number | rate in percent | number | rate in percent |
| Canada | 49,948 | 0.16 | 105,352 | 0.32 |
| Newfoundland and Labrador | 11,381 | 2.18 | -1,137 | -0.22 |
| Prince Edward Island | 1,483 | 1.09 | 74 | 0.05 |
| Nova Scotia | 9,005 | 0.97 | -2,778 | -0.30 |
| New Brunswick | 4,587 | 0.61 | 3,404 | 0.46 |
| Quebec | -222 | 0.00 | 26,088 | 0.34 |
| Ontario | 11,288 | 0.10 | 50,173 | 0.40 |
| Manitoba | -1,035 | -0.09 | -5,396 | -0.46 |
| Saskatchewan | 16,017 | 1.60 | -3,061 | -0.31 |
| Alberta | 1,604 | 0.05 | -47,801 | -1.40 |
| British Columbia | -4,347 | -0.11 | 88,057 | 2.08 |
| Yukon | -360 | -1.20 | -979 | -3.04 |
| Northwest Territories | 497 | 1.22 | -875 | -2.03 |
| Nunavut | 50 | 0.18 | -417 | -1.36 |

Note(s): The error of closure is equal to the postcensal estimate (at the census date) minus the census count adjusted for census net undercoverage (including adjustment for incompletely enumerated indian reserves). The percentage is: error of closure, divided by the census count adjusted for census net undercoverage and incompletely enumerated indian reserves, multiplied by 100.

Explanatory notes for the tables

Table 1.2

International migration

Annual population estimates and factors of growth, provincial perspective

Estimates are final intercensal up to 2005, final postcensal Population for 2006 and 2007, updated postcensal for 2008 and 2009 and

preliminary postcensal for 2010.

Natural increase Natural increase is final up to 2006/2007,

for 2007/2008 and 2008/2009 and preliminary for 2009/2010. Net international migration numbers are final up to 2006/2007,

updated for 2007/2008 and 2008/2009 and preliminary

for 2009/2010.

Interprovincial migration The numbers for net interprovincial migrants are final up

to 2008/2009 and preliminary for 2009/2010.

Total net migration numbers are final up to 2006/2007, updated Total migration

for 2007/2008 and 2008/2009 and preliminary for 2009/2010.

Numbers for total growth are final up to 2006/2007, updated Total growth

for 2007/2008 and 2008/2009 and preliminary for 2009/2010.

Table 1.3

Annual estimates of demographic components, provincial perspective

Birth The numbers for births are final up to 2006/2007, updated for 2007/2008 and 2008/2009 and preliminary for 2009/2010.

The numbers for deaths are final up to 2006/2007, updated Death

for 2007/2008 and 2008/2009 and preliminary for 2009/2010.

The numbers for immigrants are final up to 2008/2009 and **Immigrant** preliminary for 2009/2010.

Emigrant

The numbers for emigrants are final up to 2006/2007, updated for 2007/2008 and 2008/2009 and preliminary for 2009/2010.

The numbers for returning emigrants are final up to 2006/2007, Returning emigrant updated for 2007/2008 and 2008/2009 and preliminary

for 2009/2010.

Net temporary emigrant The numbers for net temporary emigrants are final up

to 2006/2007, updated for 2007/2008 and 2008/2009 and

preliminary for 2009/2010.

Net non-permanent resident The numbers for net non-permanent residents are final up

to 2006/2007, updated for 2007/2008 and 2008/2009 and

preliminary for 2009/2010.

The numbers of interprovincial migrants In-migrant final up

to 2008/2009 and preliminary for 2009/2010.

Out-migrant The numbers of interprovincial migrants are final up

to 2008/2009 and preliminary for 2009/2010.

Appendix A

Glossary

Age

Age as of July 1.

Ageing (of a population)

An increase in the **number of old persons** as a percentage of the total population.

Average age

The average age of a population is the average age of all its members.

Census coverage

Census net undercoverage: Difference between undercoverage and overcoverage.

Overcoverage: Number of persons who should not have been counted in the census or who were counted more than once.

Undercoverage: Number of persons who were intended to have been enumerated in a census but were not enumerated.

Cohort

Represents a group of persons who have experienced a specific demographic event during a given year. Thus, the married cohort of 2001 consists of the number of persons who got married in 2001. In the cast of births, persons born within a specified year are referred to as a generation.

Components of demographic growth

Any of the classes of events generating population movement variations. Births, deaths and migrations are the components responsible for the variation since they alter either the total population or the age and sex of the population.

Dependency ratio

The ratio of the combinedpopulation aged between 0 to 14 years old and the population aged 65 years and over to the population aged between 15 to 64 years old.

Emigrants

Canadian citizen or **immigrant** who has left Canada to establish a permanent residence in another country.

Error of closure

Difference between the **postcensal estimate** for the same date as the census and the results of the census adjusted for **census net undercoverage** (including adjustment for incompletely enumerated Indian reserves).

Generation

Unless otherwise specified, refers here to a group of persons born within a given period. The 2001 generation represents people born during the year 2001.

Immigrant

Within the framework of this publication, the term immigrant refers to **landed immigrant**. A landed immigrant is a person who does not have Canadian citizenship but was granted the right by immigration authorities to live in Canada on a permanent basis.

International migration

International migration represents movement of population between Canada and a foreign country which involves a change in the usual place of residence. A distinction is made with regard to **immigrants**, **emigrants**, **returning emigrants**, **net temporary emigrants** and **net non-permanent residents**.

Interprovincial migration

Interprovincial migration represents movement from one province or territory involving a permanent change in residence. A person who takes up residence in another province or territory is an **out-migrant** with reference to the province or territory of origin and an **in-migrant** with reference to the province or territory of destination.

Median age

The median age is an age "x", such that exactly one half of the population is older than "x" and the other half is younger than "x".

Natural increase

Variation in population size over a given period as a result of the difference between the numbers of births and deaths.

Net international migration

Net international migration is obtained according to the following formula: **Immigrants** + **returning emigrants** + **net non permanent residents**- (emigrants + net temporary emigrants)

Net interprovincial migration

Net interprovincial migration represents the difference between **in-migrants** and **out-migrants** for a given province or territory.

Net non-permanent residents

Net non-permanent residents represent the variation in the number of non-permanent residents between two dates.

Non-permanent residents

A non permanent resident belongs to one of the five following groups:

- persons residing in Canada claiming refugee status;
- · persons residing in Canada who hold a study permit;
- persons residing in Canada who hold a work permit;

- persons residing in Canada who hold a minister's permit;
- all non-Canadian born dependants of persons claiming refugee status, or of persons holding study permits, work permits or minister's permits and living in Canada.

Net temporary emigration

Net temporary emigration represents the variation in the number of temporary emigrants between two dates. Temporary emigration includes Canadian citizens and **immigrants** living temporarily abroad who have not maintained a usual place of residence in Canada.

Population

Estimated population and population according to the census are both defined as being the number of Canadians whose usual place of residence is in that area, regardless of where they happened to be on Census Day. Also included are any Canadians staying in a dwelling in that area on Census Day and having no usual place of residence elsewhere in Canada, as well as those considered **non-permanent residents**.

Population estimate

- (a) postcensal: Population estimate produced by using data from the most recent available census adjusted for censusnet undercoverage (including adjustment for incompletely enumerated Indian reserves) and estimate of the components of demographic growth since that last census. This estimate can be preliminary, updated or final.
- (b) intercensal: Population estimate derived by using postcensal estimates and data adjusted for censusnet undercoverage (including adjustment for incompletely enumerated Indian reserves) of censuses preceding and following the year in question.

Population growth or total growth

Variation of population size between two dates. It can also be obtained by summing the **natural increase**, **total net migration** and if possible, substract **residual deviation**. It can be positive or negative.

Precocity error

Difference between preliminary and final estimate of a particular component in terms of its relative proportion of the total population for the relevant geographical area. It can be calculated for both population estimates and component of population growth.

Rate

Refers to the ratio of the number of events estimated in a year (t,t+1) to the average populations at the beginning and the end of the period. In this regard, birth, death, immigration rates, etc are calculated. Generally, the rate is expressed in per 1,000.

Demographic growth rate or population growth rate: Ratio of population growth between the year t and t+1, to the average **population** of both these years. The rate is generally expressed in per 1,000.

Overcoverage of population rate: The ratio of the number of persons who should not have been counted in the census or who were counted more than once to the total number of persons that should have been enumerated in the census. Generally, the rate is expressed in percentage.

Undercoverage of population rate: The ratio of the estimated number of persons not enumerated in the census (who were intended to have been enumerated) to the total number of persons that should have been enumerated in the census. Generally, the rate is expressed in percentage.

Census net undercoverage of population rate: The difference between the census undercoverage rate and the census ovecoverage rate.

Residual deviation

Difference between demographic **population growth** calculated using **intercensal estimates** of population between two dates and that obtained by the sum of the components for the same period. This deviation results from the distribution of the **error of closure** between years within the quinquennial period. This distribution is calculated by taking into account the number of days within each month.

Returning emigrants

Canadian citizen or **immigrant** having previously emigrated from Canada and subsequently returned to the country.

Sex ratio

The ratio of the number of men to the number of women. This is not to be confused with the sex ratio at birth, which is the ratio of the number of live-born boys to the number of live-born girls. This ratio is usually expressed as an index, with the number of females taken to be a base of 100.

Sprague coefficients

Series of factors which, when multiplied to a population distributed by multiples age groups, give a distribution of the same population by single years of age.

Total net migration

Sum of net international and net interprovincial migration.

Vital events

Includes all the demographic events (that is to say births, deaths, marriages and divorces) for which there exists a legal requirement to inform the Provincial or Territorial Registrar's Office.

Year

Unless otherwise specified, the term "year" refers to the period beginning July 1 of a given year and ending June 30 of the following year.

Appendix B

Sources and remarks

Base population

May 16, 2006 Census of Population adjusted for census net undercoverage and incompletely enumerated Indian reserves.

2006 Census: Statistics Canada, Census of Canada, 2006, Catalogue no. 92-200-XPB.

Census net undercoverage: See The Daily, September 29, 2008.

Incompletely enumerated Indian reserves: See The Daily, September 29, 2008.

Births and deaths

Statistics Canada, Health Statistics Division.

Statistics Canada, Demography Division, catalogue no. 91-215-X, annual.

Immigration

Citizenship and Immigration Canada

Emigrants

Statistics Canada, Demography Division - from data on emigrant children from the Canada Child Tax Benefit program (CCTB) from Canada Revenue Agency files - CRA and data from the «U.S. Department of Homeland Security, Office of Immigration Statistics»

Returning emigrants

Statistics Canada, Demography Division – based on data from the CCTB program and adjustment factors calculated using CRA files.

Net temporary emigrants

Statistics Canada, Demography Division – based on data from the Reverse Record Check (RRC), 2001 and 2006 Censuses of Canada.

Non-permanent residents

Statistics Canada, Demography Division – based on data provided by Citizenship and Immigration Canada.

Interprovincial migration

Statistics Canada, Demography Division – based on the CTB program and adjustment factors calculated using CRA files.
